TERMS AND WARRANTIES

WHOLESALE DISCOUNT:

Contact MIFAB® or your local representative for your applicable discount structure.

FREIGHT ALLOWANCE: Ex Works, MIFAB's Chicago, Illinois Factory or Manufacturer Representative's warehouse with full motor freight allowed on shipments of \$5,000.00 Net or more, within the continental U.S.A., except Alaska, Hawaii and Puerto Rico. MIFAB® reserves the right to choose the carrier and route of shipment. Alaska: Ex Works, Seattle, WA. Hawaii: Freight allowed on shipments of \$5,000.00 or more only when shipped from West Coast, U.S. Puerto Rico: Ex Works, Miami, Florida. There is no allowance for United Parcel Service, Federal Express or Shipment by air service. Shipping dates are estimates and time of delivery is not the essence of the sale of the contract. Therefore, under no circumstances will MIFAB® have any responsibility on account of any delays in manufacture, transportation, or otherwise. Additional freight services such as construction site delivery, lift gate delivery service, re-consigned freight or notification charges, are not included in full freight allowance terms, and will result in additional freight charges.

QUOTATION TERMS: List Price and discount protected for 30 days from date issued by MIFAB[®]. Orders received within this period must be released for shipment within 30 days from date of purchase order, otherwise, prices will be those that are in effect at the time of shipment.

PAYMENT TERMS: Terms of payment are Net 30 days from the date of the invoice. All pricing in United States currency. The Buyer shall pay all sales, consumers, and / or any other applicable taxes. Past due accounts will be subject to a 2% per month service charge from the date of the invoice. If any proceedings be instructed by or against Buyer under any bankruptcy or insolvency law, or if Buyer shall fail to make timely payment on this or any other order, or if, in MIFAB's judgment, Buyer's financial situation justifies such action, MIFAB® may, at its election, require payment in advance or cancel the order as to any unshipped item and require payment of its reasonable cancellation charges. If Buyer delays completion of manufacture, MIFAB® may elect to require payment according to percentage of completion. Equipment held for Buyer shall be at Buyer's risk and expense. In all cases, regardless of partial payment, title to the Products shall remain with MIFAB® until payment for the Products (including any notes given therefore) has been made in full. Should legal action be necessary to enforce payment of an unpaid invoice, the Buyer will assume full responsibility for any court costs and reasonable attorney fees. All orders subject to credit check and approval prior to shipment. Confirmed irrevocable letter of credit or cash in advance of shipment is required for accounts without an established line of credit. Minimum invoice amount is \$100.00. MIFAB® reserves the right to apply a minimum order charge to equal \$100.00. MIFAB's Accounting Department must be notified of potential pricing errors within 30 days of the invoice date. Any terms and conditions stated on Buyer's orders which are inconsistent with MIFAB's quotation and Terms and Warranties shall be of no effect.

RETURNED GOODS RESTOCKING CHARGE: Standard product may be returned within a one year period only with written permission from MIFAB. All products in catalog are not considered Standard. Standard product to be determined by MIFAB[®]. Returned goods are subject to a 25% restocking charge, plus cost of reconditioning, if necessary, to make material saleable. Material must be returned to MIFAB[®] freight prepaid only after written permission from MIFAB[®] to accept the returned material. Buyer must provide copy of the original invoice on which the material was charged. The original outgoing freight cost to ship the order will be deducted from the credit. Credit allowance will be in the form of merchandise credit only-not cash credit which must be used within 12 months of the date of issue. The value of a return must total \$100.00 to qualify for credit allowance. Galvanized and acid resistant epoxy coated material will be credited to value of cast iron, and chrome plated at value of nickel bronze. No credit will be allowed for auxiliary tappings, discontinued, or made to order items. Products designated non stock and / or that have been specially made (require a sign off drawing by MIFAB[®]) are not subject to return or cancellation.

LIMITED WARRANTY: MIFAB® warrants each product against defects in material and workmanship for a period of one year from the date of original shipment. In the event of such defects within the warranty period, MIFAB® will, at its option, replace or recondition the product without charge. This shall constitute the exclusive remedy for breach of warranty, and MIFAB® shall not be responsible for any incidental or consequential damages, including, without limitation, damages or other costs resulting from labor charges, delays, vandalism, negligence, fouling caused by foreign material, damage from adverse water conditions, chemicals, or any other circumstances over which MIFAB® has no control. This warranty shall be invalidated by any abuse, misuse, misapplication or improper installation of the product.

MIFAB® MAKES NO OTHER WARRANTIES EXPRESSED OR IMPLIED AS PROVIDED IN THIS LIMITED WARRANTY.

ILLUSTRATIONS OR TYPICAL INSTALLATIONS: The typical installations for various products in each product section are intended to illustrate the products and their options. Under no circumstances are they to be construed as recommended installation procedures. Consult local codes and project specifications for proper installation instructions.

NOTE: Prices and terms are subject to change without notice and supersede all previous quotations. The right is reserved to change or modify product design or construction without prior notice and without incurring any obligation to make similar changes and modifications to product previouslyor subsequently sold. Contact MIFAB[®] for any clarification.

All sales subject to MIFAB's Terms and Warranties.

nation. Design and dimensions are subject to modification. Prices do not include applicable taxes.

OUR REPUTATION IS STAINLESS

KEY FEATURES AND BENEFITS:

- Modular system with fewer parts, reduced confusion on job site, and fewer returns.
- Standard A1 body serves as a floor drain, cleanout and roof drain. This reduces inventory.
- Cast 304 stainless steel grates and cleanout covers for same price as nickel bronze. Prevents dishing, corrosion and discoloration.
- 4" NPSM threads at top of A1 body allows drain to be installed without membrane clamp for nonwaterproof slab on grade floors.
- A1 body with no hub connection is only 3" deep for compact rough-in.
- A1 body always shipped tapped and plugged for trap seal primer connection.
- All area drain grates are adjustable and made of ductile iron with a load rating of over 10,000 lbs. for maximum on site adjustment and load bearing.
- Closet and lavatory carriers designed and packaged with features to save installation time and handling cost.

AREA DRAIN FEATURES

NOW YOU CAN SPECIFY STAINLESS STEEL AT THE SAME PRICE AS NICKEL BRONZE. SPECIFY MIFAB STAINLESS FOR A LASTING IMPRESSION

MIFAB AREA DRAIN STANDARD BENEFITS

- Ductile iron grate offers greater Í than 10,000 lb. load rating.
- Non-tilt grate is safer in all í traffic areas.
- 3/8" slots prevent large debris í from entering the drainage system.
- Fully adjustable top assembly í for ease of installation.
- Stainless Steel at the same 創 price as Nickel Bronze.

Design and dimensions are subject to modification. Prices do not include applicable taxes. Visit www.mifab.com for the most recent product information.

[®] Specification Catalog Introduction to the MIFAB

The beginnings of the modern specification drainage product can be traced back to the early part of the twentieth century. Architects began to demand a drain with secondary drainage to protect both the aesthetics and structural integrity of their buildings. Until this time, a drain was only secondary drainage, but also a clamping device to secure a waterproofing membrane in multi-story buildings. These developments ushered in the era of competition in the specification drainage market. as new manufacturers duplicated and expanded upon the

usually nothing more than a grate fitted in the end of a pipe which terminated at the floor level. Unfortunately, this led to water seeping around the pipe and the ruining of ceilings, etc., in the floors below. The design of drain а with secondary drainage meant that a drain

products of those who had produced before. More recently, the advent of the adjustable drain and the floor mounted carrier for off the floor fixtures added to the already overwhelming variety of specifiable products available to the architect and mechanical designer. Today, a specifier can

body had to be designed that allowed weepholes to remove water that may seep around the rim of the drain. Since then, architects and mechanical designers have been able to specify products that featured a variety of design considerations that were made necessary by the rapidly changing building techniques we have experienced since the beginning of the twentieth century.

As we built both higher and faster, architects and engineers realized the need for a drain with not choose from literally thousands of products from many manufacturers. A mechanical designer has to be careful at every turn to make sure he has decided between non tilt or tractor grates, between ductile and gray cast iron, between adjustable and non-adjustable top assemblies, heel proof or non heel proof grates. In short, a baffling array of options that do little to improve the basics of the design, i.e. free area and load bearing characteristics.

The MIFAB [®] Advantage

A logical, function driven product line that replaces confusion with simplicity and offers all the features required by today's building practices without all the unnecessary duplication.

13

The MIFAB ® Design

Among the many outstanding design features of the MIFAB product line, the following are unique:

• **Bodies/Modular design.** The majority of floor drains, roof drains and cleanouts illustrated in this catalog incorporate the use of only three different bodies. The A1 body is used with floor drains, roof drains and cleanouts which are subject to pedestrian or heavy traffic loads and low flow

rates. The shallow design of the A1 body allows for installation in slabs of minimum thickness. Because a membrane clamp is usually not required (the majority of drains and cleanouts are installed slab on grade), MIFAB's A1 body design incorporates an integral female thread (4" N.P.S.M.) to receive adjustable strainers or cleanout tops.

The A2 body with a 6" deep sump is used for floor and roof drains for most other applications. The A3 body with the 12" deep sump is designed for high flow applications in floors or roofs.

• Top Assemblies/Modular Design. MIFAB introduces the F1000/C1000 Series floor drains and cleanouts with Type CF8 (304) cast stainless steel strainers/top assemblies. This material offers superior corrosion resistance and will not discolor due to oxidization as well as the heavy duty load bearing characteristics

of stainless steel.

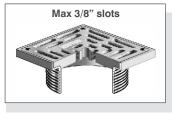

This means the elimination of dished and discolored strainers and cleanout tops when this product is specified.

MIFAB's adjustable round and square top assemblies for unfinished areas incorporate

standard ductile iron grates which ensure flush installation of the drains at the low point of the drainage area to be serviced and eliminates any unwanted movement or dishing of the grate due to heavy wheel loads. These top assemblies are available with optional stainless steel veneers to provide an attractive and heavy-duty installation in any application where an area drain with a cast or ductile iron grate alone would be unsightly, such as public promenade areas.

Maximum 3/8" wide grate drainage slots. This eliminates the need for the designer to differentiate between regular and pedestrian grates. In addition these narrow slots restrict solids from entering the drain, which reduces the

need for a sediment bucket or secondary strainer, both of which can reduce the flow rate of the drain by as much as 60%.

Other Modular Options. MIFAB's roof drain clamps are interchangeable as flashing clamp rings, deck clamps and extensions. This greatly

simplified system eliminates a significant number of parts found in other manufacturer's designs.

• **Cleanouts.** MIFAB's cleanout design incorporates a combined gasketed cover and cleanout plug at floor level which ensures the cleanout will be gas tight so long as the cover/plug is in place. The elimination of secondary plugs made of plastic, brass or iron ensures quick and simple emergency access to the drain line. An exclusive O-ring on the adjusting threads ensures 100% test seal. When MIFAB's C1000-3 stainless steel Series is specified, you can be assured that this cleanout will not discolor or dish for the life of the building.

Design and dimensions are subject to modification. Prices do not include applicable taxes. Visit www.mi

 Carrier Fittings for off the floor Water Closets. MIFAB's unique design allows one carrier to be used for most standard or ADA rough in heights. In addition a reversible faceplate allows the installation of either siphon jet or blowout bowl closets. Carriers are designed for any type of wall construction. Compact design ensures minimum pipe space requirement.

Availability/Cost MIFAB products are inventoried by full-line distributors in major cities throughout North America. Modular, interchangeable parts ensure fast delivery. MIFAB's products are realistically priced and in all cases are competitive with products of similar design and materials.

Materials and Finishes

MIFAB Stainless Steel, Suffix-3 Mifab cast stainless steel strainers are produced in Type CF8 (304) stainless steel which is an 18-8 austenitic stainless steel possessing excellent corrosion resistant characteristics. Fabricated SS veneers are formed from Type 304 SS sheet. Both cast & stainless products are polished to a number 4 satin finish. In highly corrosive areas strainers and cleanout covers are available with the option -29, Type 316 stainless steel. Body and collars assemblies in highly corrosive areas may be specified in solid cast Type 304 (-28) or solid cast Type 316 (-29).

MIFAB Nickel Bronze Suffix –1 MIFAB nickel bronze is a copper/nickel alloy (copper alloy 997) that is broadly used for adjustable strainers, funnels and cleanout tops and as veneers on standard ductile iron tops. In areas where there is a concern for discoloration due to oxidization, MIFAB stainless steel strainers, cleanout covers and area drain assemblies are recommended to be specified with solid cast strainers or cast or fabricated SS veneers.

MIFAB Acid Resistant Porcelain Enamel -A.R.E. Acid resistant porcelain enamel is a vitreous or glassy inorganic coating bonded to metal by fusion at a high temperature above 800°F. This coating is extremely hard and is ideal for sanitation in drainage applications. MIFAB's acid resistant procelain enamel coating conforms to the requirements of F.D.A. (Food and Drug Administration) Regulation 21-CFR5 117.1360.

MIFAB Ductile Iron Suffix –4 Most MIFAB ferrous grates are supplied in ductile iron that has superior shock resisting qualities in addition to greater strength when compared to gray iron.

MIFAB's ductile iron complies to ASTM specification A 536-84, Grade 60-45-10. Recommended for all areas subjected to heavy vehicular traffic. Ductile iron also exhibits superior corrosion resistance when compared to regular gray iron.

MIFAB Coated Cast Iron Suffix –50 All MIFAB floor drain, roof drain and cleanout bodies, collars and clamping rings are manufactured with cast iron material that conforms to ASTM specification for Gray Iron Castings A 48-83, Class 25. MIFAB cast iron has excellent resistance to corrosion in normal drainage applications because of the high quality coating which prevents rusting or discoloration in normal applications.

MIFAB Acid Resistant Epoxy Coating, Suffix

-11 Acid resistant epoxy coating is a baked-on powder coating, which produces a smooth, hard, high gloss finish. This epoxy based coating offers high impact resistance and long life expectancy in all applications. MIFAB's -11 coating conforms to the requirements of the F.D.A. (Food and Drug Administration) Regulation 21-CFR5 117.1360.

MIFAB Galvanized Cast Iron, Suffix -13 MIFAB galvanized cast iron is a process applied to specially prepared gray or ductile iron castings. This coating contains 95% zinc and increases longevity and is recommended where the discoloration or oxidization of iron or steel is objectionable. Galvanizing is recommended in coastal or industrial areas where a corrosive atmosphere may be encountered. MIFAB galvanizing meets or exceeds Government specification MIL-P-26433, MIL-P-21035, MIL-P 26915A and MIL-C-10578 (Type II). It also meets ASTM A239-89.

MIFAB Aluminum: Casting grade 319. This is an alloy that contains silicon and copper. It is a solid cast metal.

15

sales@mifab.com • Canada Toll Free: 1-800-387-3880 All sales subject to MIFAB's® Terms and Warranties. Please refer to inside front cover.

Except for MIFAB, the specification drain manufacturers include a membrane clamp in most, if not all of their floor and area drains to receive fixed (non-adjustable) or adjustable top assemblies.

Most floor and area drains are installed in "slab on grade" areas where no waterproofing membrane is required.

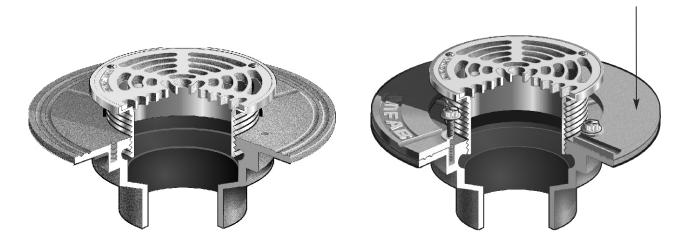

The MIFAB body design incorporates a female thread to accept adjustable top assemblies up to 9" diameter or 8" square and lugs on the larger bodies which receive top assemblies 12" diameter and larger. THIS FEATURE SIGNIFICANTLY REDUCES THE INSTALLED COST OF MOST FLOOR AND AREA DRAINS BECAUSE THE **INSTALLER CAN AVOID USING AND PAYING FOR THE MEMBRANE CLAMP.**

When MIFAB drains are installed in waterproofed areas, an optional (Suffix -C) membrane clamp is available.

Non membrane floors (no waterproofing) (90% of "on grade" applications)

Membrane floors (with waterproofing) (**10%** of applications)

WITH MEMBRANE CLAMP

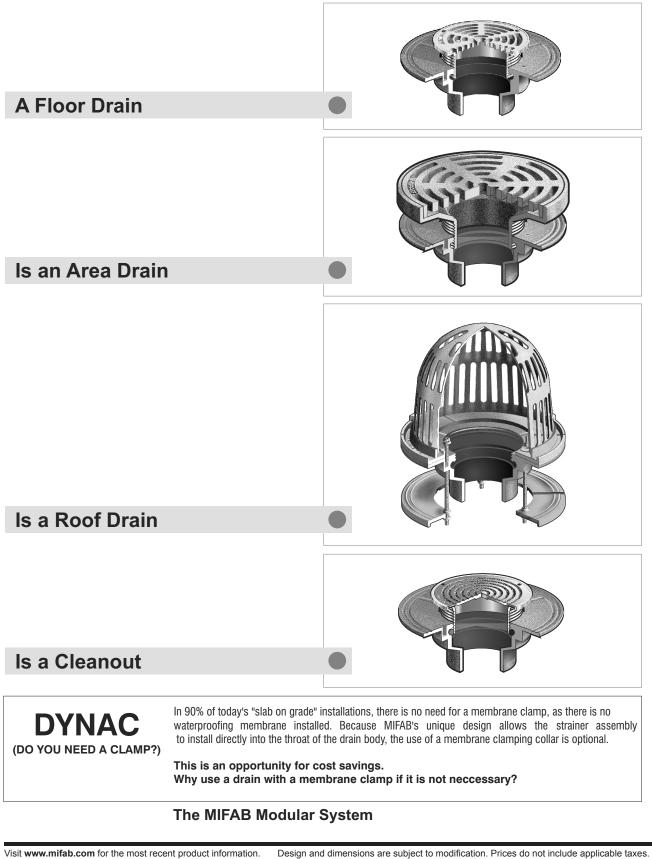

Specify MIFAB'S floor drains with heavy duty stainless steel strainers FOR THE SAME PRICE as conventional floor drains with membrane clamps and light duty nickel bronze strainers.

<u>; MIFAB</u>

MIFAB Floor Drain Selection Guide

Floor drains and accessories combine to form the upstream or entrance terminals of a building's floor drainage system. Area drains serve in a similar capacity for drainage of surface areas immediately adjacent to the building. The selection and specification of drains for interior floor areas and exterior surface areas merit careful consideration. Such factors as size, shape, function and anticipated drainage requirements of the area must be taken into account when planning for adequate and proper drainage of the area. These elements are of equal importance when sizing and locating the drains and drainage lines to which they are connected. Furthermore, many factors concerning plumbing and building codes apply, so it is recommended that they be consulted at the outset of selection and specification considerations.

SIZING

The potential volume of drainage to be accommodated by drains serving interior areas can, as a rule, be calculated with reasonable accuracy using the total amount of water within the area as a basis for sizing. The area's function as well as types of water use equipment used within the area must be considered. For example, a public restroom, with its numerous types of water use fixtures, must include drains sized and located to handle potential overflow due to stoppage as well as routine custodial waste from cleaning by-products. In addition to plumbing fixtures, water requiring floor drainage emanates from man's sources such as run-off from vehicles in garage areas, condensate waste and processed water discharge from equipment hose stations, and emergency drainage as from sprinkler systems or spills. It is a good practice to provide floor drains in any area where a water source is located. Moreover floor drains should be adequately sized and strategically located to avoid standing water on the floor, a potentially hazardous condition. Sizing of area drains for surfaces adjacent to the building is normally based on rainfall and size of the area to be drained. Information concerning such sizing is provided in the MIF AB Roof Drain section of this catalog. Placement of area drains depends on the topography of the area with drains placed at the low points where run-off is anticipated.

SPECIFIC POINTS FOR CONSIDERATION

After the preceding drainage requirements have been resolved and the drainage piping system is developed, the proper floor and area drains to serve the system must be selected and specified. There are a number of points to consider for such selection, knowledge of which will be of assistance in arriving at the proper decision, Comprehensive information on each of the following points for consideration is essential:

- location requirements
- floor construction traffic conditions
- drain top and outlet sizes drain top, materials and appearance
- trapping of sediment
- backflow prevention
- indirect waste
- drain outlet connections

LOCATION REQUIREMENTS

The locations within and adjacent to the building structure which require provisions for drainage are many. Some significant locations for which drains must be selected are toilet and shower rooms, boiler and equipment rooms, basements, garage and parking areas, kitchens, laundry, utility and service rooms, elevator pits, entry areas, machining and processing areas. refrigeration rooms.... the list goes on and on. Drains should be considered and selected for any location where water is supplied and surface drainage must be accommodated.

FLOOR CONSTRUCTION

Floor construction has a distinct influence on drain selection and therefore must be considered at the outset of the selection process. Such elements as slab type and thickness, surface finish, depth of fill, waterproofing membrane and/or finishing materials will influence the selection. Installation drawings, on pages iv through vii of this section, depict various MIFAB floor drains in different types of construction for reference.

Visit www.mifab.com for the most recent product information.

Design and dimensions are subject to modification. Prices do not include applicable taxes.

MIFAB Floor Drain Selection Guide (Cont'd)

TRAFFIC CONDITIONS

Once installed, floor drains become integral components of the floor or area in which they are located. Therefore, the drain selected for each installation must have tops or grates capable of sustaining the type of load to be supported by the floor. This is particularly significant where drains selected are installed in traffic locations. It is recognized that top-loading requirements vary with the location, type of construction and service conditions. These requirements for floor and area drains are addressed in American National Standards Institute, Floor Drains, ANSI A112.6.3-2001.1M-2001 with the following five top loading classifications:

LIGHT DUTY - all grates having safe live load under 2000 lbs.

MEDIUM DUTY - all grates having safe live load between 2000 and 4999 lbs.

HEAVY DUTY - all grates having safe live load between 5000 and 7499 lbs.

EXTRA HEAVY DUTY- all grates having safe live load between 7500 and 10,000 lbs.

SPECIAL DUTY - all grates having safe live load over 10,000 lbs. shall be considered special and treated accordingly

The safe live load is computed by dividing the load at failure by two when the grate is loaded in accordance with the test procedure stipulated in the standard. A 3 1/2" (89) diameter platen was used during the load rating test and applied to the center of the grate. Using these top-loading classifications as a guide when loading requirements for the drains in a given location have been determined, the duty type required can be selected. MIFAB floor drains in this catalog are duty rated as an aid to selection. For additional information where a rating is not clear for unusual service conditions, contact MIFAB Customer Service.

DRAIN TOP AND OUTLET SIZES

A drain's top size, regardless of its shape-round, square, etc.-influences the number and size of openings between support members, which in total account for the grate's open or free area. Normally, the larger the top the greater the free area. Free area is the key factor used in evaluating the grate's ability to permit sufficient drainage to enter the drain for efficient utilization of the drainage system and prevent build-up of water on the floor or area served by the drain. Codes and standards stipulate that for proper drainage, interior floor drains should have a grate free area equal to one and one-half times the transverse area of the connecting pipe and exterior area drains, subject to rain-fall, two times that of the connecting pipe. Thus, it is important in the selection of floor and area drains to consider the top and outlet sizes as they relate to each other. The following tabulation, taken from ANSI Floor Drain Standard A112.6.3-2001.1M-2001 provides at a glance the grate free area requirements for outlet sizes, thus connecting pipes, based on the ratios given.

DRAIN OUTLET CONNECTION SIZE (SQ. INCHES)	TRANSVERSE AREA CONNECTING PIPE (SQ. INCHES)	GRATE FREE AREA, MINIMUM (SQ. INCHES) INTERIOR	EXTERIOR
2	3.14	5.0	6.5
3	7.06	11.0	14.0
4	12.5	18.0	25.0
5	19.6	30.0	40.0
6	28.3	42.0	56.0

DRAIN TOP MATERIALS AND APPEARANCE

Cast iron is the primary material used in the production of floor drain components. MIFAB floor and area drains are cast in gray cast iron having a tensile strength of 25,000 to 30,000 psi. The ASTM specification for MIFAB's gray iron castings is A 48-83, class 25. Cast ductile iron tractor grates are usually recommended according to duty type for most locations where more than appearance, is the service. determining factor. For example, warehouses, equipment rooms, garages, basements, and service and machine areas in locations where severe service conditions, such as shock or impact loading are factors. Beyond ductility, ductile iron has superior strength to regular cast iron. The combination of strength and ductility make ductile iron the logical choice for such locations. In addition to our ductile iron grates for unfinished areas, MIFAB manufactures adjustable strainers of type CF8 (304) cast stainless steel. For larger capacity drains, with 7" to 24" top assemblies, MIFAB provides cast or fabricated stainless steel veneers polished to a number 4 satin finish. The use of stainless steel versus conventional nickel or polished bronze ensures that there will be no broken or dished grates or any discoloration due to oxidization. Most MIFAB stainless steel top assemblies and strainers are priced competitively with our conventional nickel bronze products.

MIFAB Floor Drain Selection Guide (Cont'd)

TRAPPING OF SEDIMENTS

There are few, if any, floors and areas that are free of sediments, debris, and bits of non-liquid waste that will gravitate to the floor drains. Such materials, if permitted to enter drains and drain lines unchecked, will inevitably lead to messy stoppage of the lines. Obviously proper custodial maintenance of the locations will preclude excessive amounts of such materials from entering the drains. However, the presence of a certain amount of debris is unavoidable. Therefore, preventive measures should be taken to assure free drainage without stoppage. Most MIFAB drains are designed with maximum 3/8" openings, which allows only solids that are transportable through the drainage system. Sediment buckets or baskets may be used in areas such as washrooms and showers to intercept valuables and hair. Floor drains, area drains and catch basins which have indicated openings in their grates in excess of 3/8" should have secondary strainers or sediment buckets specified in areas where sediments may clog drain lines. Specification of sediment buckets in all MIFAB drainage products may be indicated by specifying suffix -5.

BACKFLOW PREVENTION / TRAP SEAL PRIMING

Backflow through floor drains, a most undesirable and sometimes damaging condition, due to either clogged interior drain lines or overloaded sewers, can be effectively retained through employment of backwater valves. The most common type of backwater valve used in floor drains is the swing check and float types; either of which with proper maintenance will perform effectively for the purpose intended. When selecting drains for locations below curb or street elevation, where gravity drainage to the main sewer is planned, backwater valves should be used in any locations where backflow conditions could develop. When considering backflow prevention, it is the logical time to also consider prevention of inflow of noxious sewer gas. Most codes specify that floor drains shall connect into a trap and that the trap

seal be maintained to prevent the inflow of sewer gas. In locations where floor drains with integral traps or connected traps will be subject to infrequent use, evaporation with

loss of trap seal is probable. Therefore such drains should be provided with trap seal primer connections, to permit hook-up of seal water replenishment piping from a trap seal primer valve to maintain the trap seal. Specify suffix -7

INDIRECT WASTE

In locations where equipment will be producing indirect waste such as condensation, which cannot be piped directly into the drainage system, the drainage is normally directed to a

floor drain through discharge piping terminating above the drain. In these locations the floor drains should be equipped with funnels to direct the discharge into the drain and to

avoid splashing. The remaining grate free area outside the funnel in such drains is open for normal floor drainage. Floor drains with funnels must not be installed in traffic areas. Round funnels accommodate drainage from a single indirect source, while oval funnels are designed to receive drawings from more than one source. MIFAB offers a broad range of independent funnels for attachment to floor drains of the specifier's choice, and floor drains featuring funnels as standard equipment. These products merit consideration when specifications for handling indirect drainage in such locations are being developed.

<u>⊹ MIFAB</u>®

MIFAB Typical Floor Drain Installations

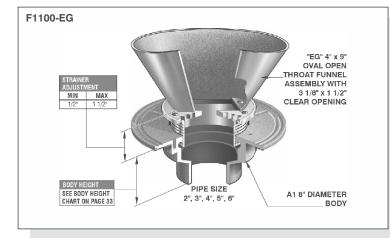

SHOWER ROOM DRAIN

Shower drains are available with round, square or rectangular grates of different sizes to provide the drainage capacity or shape desired. This drain is provided with a seepage flange and clamping means to secure the waterproofing membrane to the floor drain body. The strainer is vertically adjustable to allow for variations in finished floor thickness. The strainer at floor level is an attractive polished Stainless Steel, suffix -3. Polished Nickel Bronze, suffix -1 is optional.

24

UNIVERSAL FLOOR DRAIN

Too often, a shower drain is selected for use in areas where the traffic load (either pedestrian or vehicular) may be unknown and too heavy for a shower drain grate. We have developed a universal floor drain that is suitable for use in shower or toilet rooms as well as any other finished or unfinished floor area. It is furnished with a round or square heavy duty stainless steel grate, to prevent Some of the optional dishina. variations available on the basic floor drain are a trap primer tapping, internal sediment bucket, internal backwater valves and top funnels for use as an indirect waste drain.

INDIRECT WASTE DRAIN

The F1100-EG version is shown here with an oblong funnel to provide an indirect waste connection. Open site or drip drains are primarily for condensate producing equipment and other mechanical equipment where a direct connection is not desired or permitted. The funnels are available in a round design for a single pipe waste and in oblong sizes for multi-pipe waste lines.

Design and dimensions are subject to modification. Prices do not include applicable taxes. Visit www.mifab.com for the most recent product information.

MIFAB®, Inc., 1321 West 119th Street, Chicago, Illinois 60643-5109, USA All sales subject to MIFAB's® Terms and Warranties. Please refer to inside front cover. sales@mifab.com • Canada Toll Free: 1-800-387-3880

FLOOR DRAIN SELECTION GUIDE

TRAPPING OF SEDIMENTS

There are few, if any, floors and areas that are free of sediments, debris and bits of non-liquid waste that will gravitate to the floor areas. Such materials, if permitted to enter drains unchecked will lead to messy stoppage of the lines. Therefore, preventive measures should be taken to ensure free drainage without stoppage. MIFAB offers a complete range of sediment buckets for all applications (see details below). In addition, the specifier should consider that all of MIFAB's area drains are engineered with 3/8"maximum openings in the grates to prevent large matter from entering the drains, thus often rendering the sediment bucket unnecessary. Elimination of sediment buckets in area drains can increase flow by 60% since clogged sediment buckets are infrequently cleaned. Larger openings in grates often require sediment buckets that then clog and get thrown away, exposing the drainage system to unfiltered sediments, leading to expensive drain line maintenance. Sediment buckets may be used with MIFAB's floor drains in areas such as washrooms and showers to intercept valuables and hair. Choose Suffix-5 for the specification of sediment buckets. When sediment buckets are not available, a secondary dome strainer (Suffix-20) or a secondary flat strainer (Suffix-21) may be specified.

True-fit bucket design ensures bucket replacement after cleaning since the top grate cannot be inserted unless the bucket is in place because the grate is set into the bucket and the bucket suspends within the top assembly. Integral with F1320-TFB, F1340-TFB and F1360-TFB area drains.

Stainless steel (A1-SSB-3) and plastic sediment buckets (A1-PB) are engineered to suspend from the inside ledge of floor drain strainer shanks.

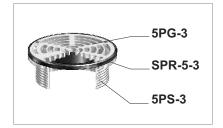

Cast iron (A1-MB) sediment buckets are engineered to suspend from the recessed, inside ledge, of the small area drain (F1300-TA, F1320-TA, F1420-TA) top assemblies. Stainless steel (A1-MB-3) sediment buckets are also available for use with nickel bronze and stainless steel top assemblies

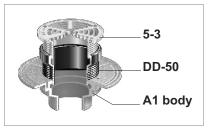

Cast iron (A2-MB) sediment buckets are engineered to suspend from the recessed, inside ledge, of the large area drain (F1340-TA, F1360-TA, F1440-TA, F1460-TA) top assemblies.

FLOOR AND AREA DRAINS

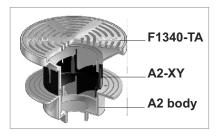

EXTENSIONS

The SPR-5-3(-1 for NB) is used with 5-1 and 5-3 strainers to increase the height of the strainer to match discrepancies in the finished floor grade. Any number of rings can be added on top of each other. Each ring adds 3/8" of height. Simply remove the grate, place the SPR-5-3(-1 for NB) into the cast in place shank, and then screw the grate into the ring. Longer bolts are provided by MIFAB. The vertical height of the strainer can be adjusted after the drain is poured in place.

The DD-50 extension is used with A1 and A4 bodies to receive any strainer or cleanout top with a 4" N.P.S. shank. The DD-50 has an adjustment range of 1 1/2" to 2 5/8".

The A2-XY is used with A2 and A3 bodies to receive the F1340-TA, F1360-TA, F1440-TA and F1460-TA top assemblies. It has an adjustment range of 3 7/8" to 5 3/8". The top assembly can be adjusted side to side to align with the floor tiles without changing vertical height. This is a benefit in promenade areas where the installer must align square tiles with the drain top assembly. The A2-XY is independent of the body and the top assembly is independent of the A2-XY.

FLOOR DRAIN SELECTION GUIDE

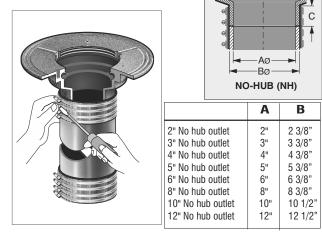

DRAIN OUTLET CONNECTIONS

Floor drains, are available in a variety of outlet connection types. The drain's outlet connection must be compatible with those of the drainage piping system to which it is connected. The most commonly employed connection types are as follows:

1. NO-HUB (NH) (A/K/A Mechanical Joint)

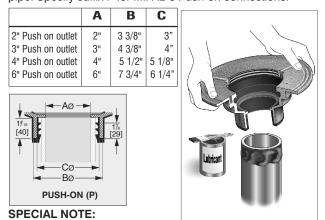

The most widely used connection. A No-Hub connection is achieved by butting No Hub soil pipe or plastic pipe to the bottom of the drain and securing it with a NO HUB coupling. (MI-HUB and MI-XHUB no hub couplings are available from MIFAB - see page 121).

Unless specified otherwise, all of MIFAB drains are shipped standard with No-Hub connections.

2. PUSH-ON (P)

MIFAB "Push-on" is a unique labor saving compression gasketed connection designed to simply push on the stub end of the pipe. The Push-on drain body and gasket can be utilized with plastic, steel, No-Hub and service weight soil pipe. A unique pipe stop cast in each MIFAB Push-on drain body ensures that water will not accumulate around the connecting pipe. Specify suffix P for MIFAB's Push-on connections.

MIFAB "Push-on" gaskets are designed for use exclusively with MIFAB drainage products. They are not sold separately and all warranties either expressed or implied would be forfeited if used in other than a MIFAB drainage product. MIFAB's 2", 3" and 4" gaskets are designed to be used with both PVC and service weight (cast iron) pipe.

All sales subject to MIFAB's Terms and Warranties. Please refer to inside front cover.

3. THREADED (T)

MIFAB Iron Pipe Threaded connection is an old industry standard. The female (NPT) threaded outlet is often specified on industrial and institutional applications. Specify suffix T for MIFAB's threaded connection

		-		
٦.		•	T T CØ	
	Т	HRE/	ADED (T)
		Α	В	С

6" Threaded		6"	7 3/4"	15/16"
8" Threaded	d outlet	8"	9 3/8"	1 1/8"

4. INSIDE CAULK (X)

The Inside Caulk drain outlet connection is a bottomless hub into which the drainage pipe is inserted. The bottom of the outlet is sealed with oakum in the annular space between the pipe and the hub and the connection is then sealed with melted lead. Inside caulk connections are compatible with No-Hub, service weight and extra heavy soil pipe. They can also be used with ABS and PVC pipe. Specify suffix X for MIFAB's inside caulk connections.

MIFAB Typical Floor Drain Installations (Cont'd)

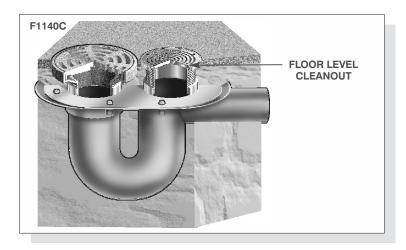

GENERAL PURPOSE FLOOR DRAIN

This floor drain is suitable for any application where traffic loads and waste water flows are expected. This drain has provision for securing waterproofing membranes to the drain body and provides for final vertical adjustment to finished floor level by the adjustable body collar. Optional variations such as a sediment bucket to retain debris and round or square polished grates and top frames are available.

INTEGRAL TRAP FLOOR DRAIN

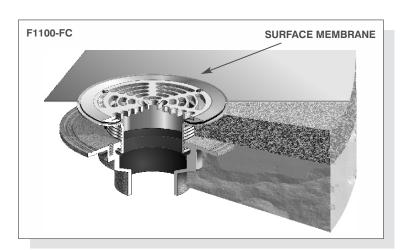

One of the most practical floor drains to be developed is a floor drain with an integral deep seal trap and No Hub side outlet connection. This drain is ideal for use in floor areas built on grade where the sewer line is shallow. The drain body has a floor level cleanout opening and may be supplied with such optional variations as a sediment bucket, seepage or anchoring flange and an internal backwater valve for back-flow protection.

FLOOR DRAIN WITH SURFACE MEMBRANE CLAMP

This type of floor drain is designed for installation where a water-proof seal is required at the top level of the grate. The adjustable strainer has a twopiece beveled nickel bronze top which clamps the top flashing material securely to the drain to ensure a water tight joint.

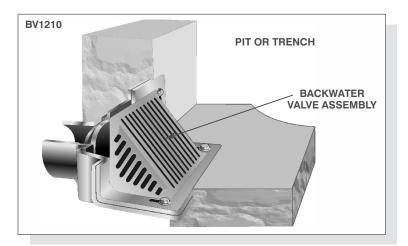

Design and dimensions are subject to modification. Prices do not include applicable taxes.

.<u>⇒.</u>MIFAB®

MIFAB Typical Floor Drain Installations (Cont'd)

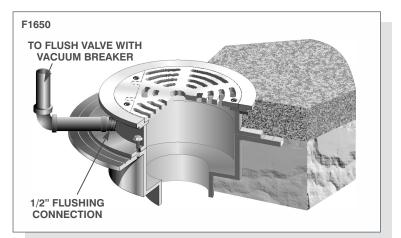

PIT DRAIN

This type of drain is used in elevator pits, pools and trenches where a side wall outlet is required. The angle grate is located in the wall to prevent blockage by debris. It is supplied with a gasketed seal type backwater valve to prevent backflow of waste water into the pit or sump being drained.

WIDE FLANGE DECK DRAIN

Special drains are available for thin deck or floor covering. A 4" wide flange, which is recessed the same thickness as the deck covering. provides a large bearing surface for the bonding of the neoprene, latex or similar waterproof deck material. This type of deck finish is used in traffic areas such as promenade decks, plazas, recreation areas and interior floors.

FLUSHING RIM FLOOR DRAIN

A flushing rim floor drain is desirable in mortuaries, prison wards, hospitals, sanatoriums and veterinary establishments where sanitary wastes are to be disposed through a floor drain. The interior surface of this type of drain is coated to provide maximum sanitation. The flushing connection enters the body to provide a peripheral washing action on the entire inner surface to dispose of sanitary waste matter. Several types of grates are available. A perforated hinged grate is recommended to intercept solids while disposing of fluids. A loose-set or secured "oriental" bar-type grate would be used in areas where both solid and fluid wastes are to be discharged.

Design and dimensions are subject to modification. Prices do not include applicable taxes.

Visit www.mifab.com for the most recent product information.

FLOOR AND AREA DRAINS

28

MIFAB Typical Floor Drain Installations (Cont'd)

GARBAGE CAN WASHING DRAIN

This type of drain is designed to serve as a combination floor drain and garbage can washer. The drain is furnished with a spray nozzle that is designed to thoroughly scour the inside of garbage cans. The top grate and large sediment bucket intercept waste debris washed down from the cans. A 1/2" water supply connection is provided on the side of the drain body to accommodate hot, cold or mixed spray water. The water supply should be connected through a vacuum breaker and control valve easily accessible to the cleaning personnel.

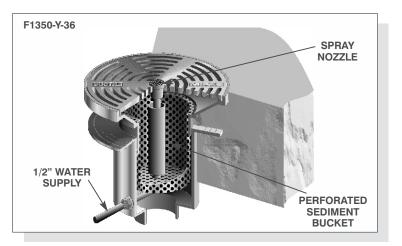

(See catalog page 74, F1670)

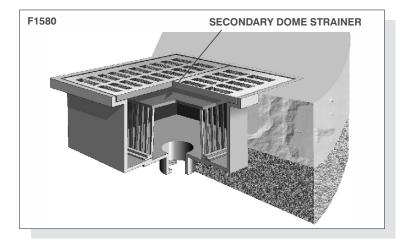

HEAVY DUTY ROADWAY DRAIN

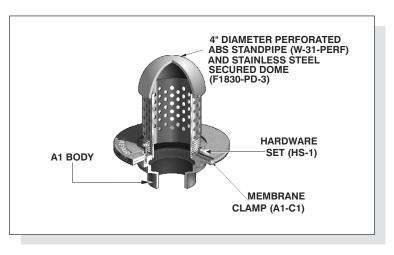

This drain is recommended for use in outside areas in yards, airports and parking areas that are subject to heavy vehicular traffic and where a large drainage capacity is required due to rainfall. The standard heavy duty cast iron grate has a maximum load capacity of 12,000 lbs. If specified with a Ductile Iron grate, the load capacity would be in excess of 25,000 lbs.

PLANTING AREA DRAIN

Although a planting area drain may not be considered a true floor drain, we have included it in this catalog. It is designed for use in planting areas or flower boxes indoors or out where drainage of excess moisture is required without loss of the soil. The perforated adjustable standpipe and dome may be located as shown or ordered long enough to extend to finished grade level to provide easy access for rodding if the occasion occurs. The floor drain body is designed to provide a means to secure the planter floor pan or waterproofing membrane to the drain

MPB-2019-USA

ALLSTAR© COVER

Allstar cover with any MIFAB A1 body

MIFAB's new, patent pending Allstar© cover is available in 5" and 6" round sizes to work with any of MIFAB's 5" and 6" round nickel bronze or stainless steel floor drain and cleanout tops.

It is manufactured from recycled plastic and is designed to fit into any of MIFAB's A1 and A4 PVC, ABS or cast iron bodies.

Contractors fit the Allstar cover into the top of the MIFAB drain body before the concrete contractors to measure the level of the concrete floor from the top of the Allstar cover.

After the concrete pour around the top of the Allstar cover, the Allstar cover is removed with a channel lock tool placed into the recessed slot in the middle of the cover and pried off.

The 4" NPSM threads machined into the top of all of MIFAB's A1 and A4 bodies are then exposed to allow the contractor to thread in any MIFAB 5" (use the 5" Allstar cover) or 6" (use the 6" Allstar cover) round floor drain and cleanout top into the top of the bodies. The tops can be adjusted to the finished floor.

There is only a 1/8" space around the outside diameter of the floor drain or cleanout top of finished off with grout.

The Allstar cover is appropriately 3/4" high and is made from smooth plastic material with angled sides to ensure removal after the pour.

There are several advantages to the Allstar cover:

1) The contractor can avoid taping the floor drain and cleanout tops prior to installation to ensure that they are protected during the construction process. This eliminates time to tape the floor drain / cleanout tops and also eliminates cleaning time to remove the tape from them before the project is handed over to the client.

2) The contract can avoid installing the floor drain and cleanout tops until the end of the project-

reducing the risk that they will be stolen or damaged.

(3) The floor drain / cleanout tops can be adjusted to the finished floor after the concrete pour.

4) The Allstar cover can be purchased separately from the floor drain and cleanout bodies.

5) The Allstar cover can be used over and over again.

FLOOR DRAINS

30

FLOOR DRAIN, ROOF DRAIN AND CLEANOUT MODEL NUMBER STRUCTURE

ROOF DRAINS (R1200 Series as the example)

1) Outlet connection size is always stated by the last of the four digits in the model number.

For example: R1204. The 4 indicates a 4" no hub outlet connection. If there is no letter following the fourth digit, then the outlet connection is no hub (most common). Alternative outlet connection types, P (push on), T (threaded), X (inside caulk), -28 (Type 304 stainless steel), -29 (Type 316 stainless steel), -30 (PVC outlet connection) or -31 (ABS outlet connection) would follow next.

For example: R1204P. The P indicates a 4" push on outlet connection.

For example: R1204-30. The -30 indicates a 4" PVC outlet connection.

2) Roof Drain Series is always stated next by the suffix following the outlet size and type.

For example:, R1204-30-EU. The –EU indicates that this is the –EU Series roof drain. The R1200 Series roof drain has the following standard Series of drains: -BUV, -EU, -F, -G, -HC, -JC, -PR, -PR15, -R, -RS, -W, -Z and –90 (found on pages 79 through 86 of the price book)

3) Alpha, then, numeric options follow the roof drain Series.

For example, R1204-30-EU-B-M-80-6. The –B and –M-80 (-M-80 is one option (low profile aluminum dome and should not be separated) are in alpha order following the Series (-EU) followed by the –6 option in numeric order.

FLOOR DRAINS (F1100 Series as the example)

1) Outlet connection size is always stated by the last of the four digits in the model number.

For example: F1103-C-5-1. The 3 indicates a 3" no hub outlet connection. See same explanation as in the Roof Drain section for the other outlet connection variables.

2) Clamp ring or no Clamp ring? is always stated after the outlet size and type.

For example, F1103-30-C-5-1. The –C indicates that there is a clamp ring. F1103-30-5-1. Indicates that there is no clamp ring.

3) Size (type) and material finish of strainer is always stated after the clamp ring suffix (or outlet type and size if no –C).

For example, F1103-30-C-5-1. The –5-1 indicates that the strainer is 5" round and that it is nickel bronze material. **For example**, F1103-30-C-S6-3. The –S6-3 indicates that the strainer is 6" x 6" square and that it is stainless steel material.

For example, F1444-175-3-5-13. The -175-3 indicates that the strainer has a three quarter grate with a stainless steel veneer. The -5 indicated that the drain has a sediment bucket and the -13 indicates that the body and sediment bucket are galvanized.

4) Numeric options then follow

For example, F1103-30-C-5-1-5-6-15. The second -5 indicates a sediment bucket, the -6 indicates security screws and the -15 indicates an extension.

CLEANOUTS (C1100 Series as the example)

1) Outlet connection size is always stated by the last of the four digits in the model number

For example: C1104-R-1. The 4 indicates a 4" no hub outlet connection. See same explanation as in the Roof Drain section for the other outlet connection variables.

2) Size (type) and material finish of cover is always stated after the outlet size.

For example, C1104-R-1. The –R-1 indicates that the cover is 5" round and that it is nickel bronze material. **For example**, C1104-S-3. The –S-3 indicates that the cover is 5" x 5" square and that it is stainless steel material.

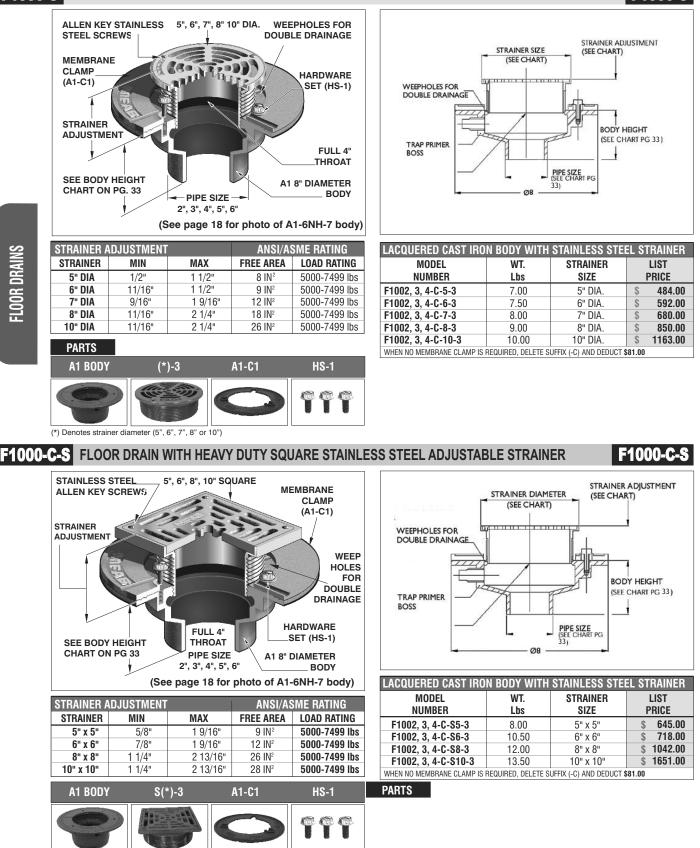

3) Numeric options then follow

For example, C1104-R-1-6. The -6 indicates security screws.

Because MIFAB's unique design allows the strainer assembly to install directly into the throat of the drain body, the use of a membrane clamping collar is optional. This is an opportunity for cost savings. (DO YOU NEED A CLAMP?) Why use a drain with a membrane clamp if it is not neccessary?

The plates are made with a variable pipe opening, six support stud holes and three nail holes. They can be used with MIFAB's 2", 3" or 4" A2 bodies.

PODIUM DRAIN SOLUTIONS

INTRODUCTION:

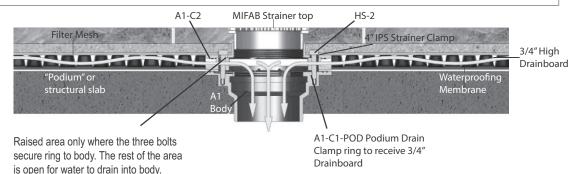

MIFAB offers a number of podium drain solutions for different types of applications. Contractors have told us that installing floor drains within a podium system is not easy because of the need to properly accommodate the 3/4" drain board that is typically installed underneath the pavers in podiums. The unique MIFAB podium drain solution allows for full flow of water off the drain board into the sump of the drain body. It also properly secures the water-proofing membrane around the entire body - providing 100% clamping around the drain opening.

MIFAB offers podium drain solutions for the following applications: 1) drain installed at grade level with podium pavers, 2) drain installed below grade level underneath the pavers, 3) drain installed at grade level in a planter area - with an adjustable system to accommodate depth of the planter and 4) drain installed at grade level in a pet relief area on the podium. Typical installation illustrations and explanations for each are provided below.

PAVER PODIUM DRAIN SOLUTIONS F1100-C-PV-PAVER (PAVER PODIUM SYSTEM)

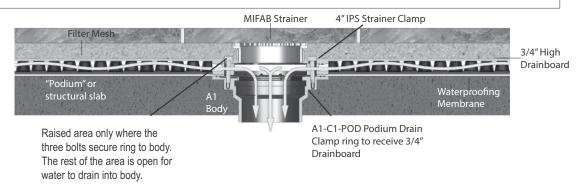

MIFAB's podium system allows <u>full unrestricted drain flow</u> of water off the drain board into the sump of the drain body while properly securing the membrane around the entire body (not just at some anchor points) – providing 100% clamping of the membrane around the drain opening. The installer typically has the option of trimming out the strainer to finish grade or below the pavers per the illustration below.

List price \$660.00 (for 2", 3" or 4" outlet and 5" dia. NB or SS strainer) See page 33 for optional variations and page 46, 47 for different strainer options.

F1100-C-BP (BELOW PAVER PODIUM SYSTEM)

List price \$660.00 (for 2", 3" or 4" outlet and 5" dia. NB or SS strainer) See page 33 for optional variations and page 46, 47 for different strainer options.

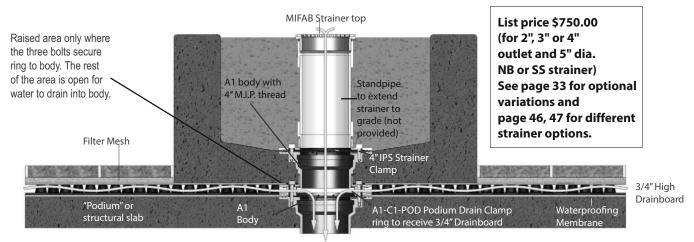

Note: This is the typical installation for the below paver podium system. Check with contractor for installation required for each jobsite.

Visit www.mifab.com for the most recent product information. Design and dimensions are subject to modification. Prices do not include applicable taxes. Toll Free: 1-800-465-2736 • Fax: 1-773-341-3049 MIFAB®, Inc., 1321 West 119th Street, Chicago, Illinois 60643-5109, USA sales@mifab.com • Canada Toll Free: 1-800-387-3880 All sales subject to MIFAB's® Terms and Warranties. Please refer to inside front cover.

F1100-C-PLA (PLANTER PODIUM SYSTEM)

Typically used in planters which are integrated into various locations across the podium. Planters require a secondary concrete pour - over the podium's primary drainage membrane.

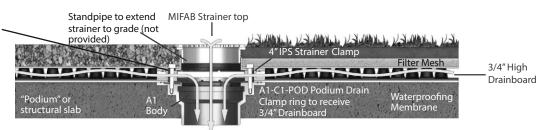

MIFAB's system allows the use of a second drain body to properly drain and waterproof the interior of the planter.

The plumbing contractor has the option of assembling a 4" diameter pipe between MIFAB's top A1-C2 membrane clamp and the underside of the strainer at grade or leaving it to the landscaping contractor to finish the standpipe to grade. Either way, the completion of the planter drainage system is performed by the landscaper when the planter is filled with soil.

F1100-C-PET (PET RELIEF PODIUM SYSTEM)

List price \$660.00 (for 2", 3" or 4" outlet and 5" dia. NB or SS strainer) See page 33 for optional variations and page 46, 47 for different strainer options.

Raised area only where the three bolts secure ring to body. The rest of the area is open for water to drain into body.

Similar to a planter, a pet relief area requires the use of a secondary drain body and has a strainer installed at grade to adequately accept runoff areas during storm situations into the drain body and not across the podium.

MIFAB's podium system allows full unrestricted flow of water off the drain board into the sump of our drain body while properly securing the membrane around the entire body (not just at some anchor points) – providing 100% of clamping of the membrane around the circumference of the drain opening. The installer typically has the option of trimming out the strainer to finish grade or below the pavers per the illustration above.

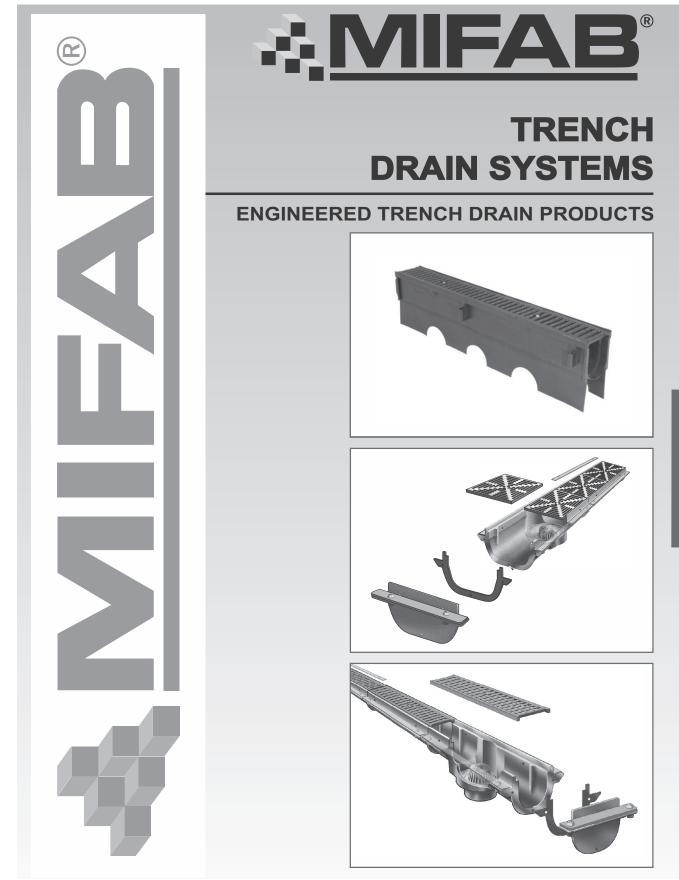

MIFAB'S ENGINEERING TEAM WILL DESIGN THE PODIUM DRAIN SYSTEM FOR YOU AT NO COST.

<u> MIFAB</u>

KEY FEATURES AND BENEFITS

SUPPORT BOARD - Every body section shipped with a support board assembled into the top of the body to maintain rigidity during the concrete pour and to keep debris out of the trench. This is standard with every body section and eliminates the time and money required to purchase and cut plywood to place inside of the bodies.

LIGHTWEIGHT AND STRONG - Body sections are made of polypropylene material which is acid resistant and lightweight for easy handling. Lightweight body sections take less time to install than heavy, polymer concrete bodies and are less likely to break during shipment. They are also less costly to transport

BODY SUPPORT LEGS - Legs are

molded into the bottom of the bodies. They support the body in the trench after pre-mix is poured. This can eliminate the need for time consuming and costly rebar supports.

INTERLOCKING BODIES - Body

sections easily snap together. No screws or hardware are required which can save time during installation.39.37"Length for easy handling and transport on standard sized pallets to save transport cost.

GRATE LOCKDOWN HARDWARE -

Field adjustable to position anywhere inside of the body. Grates can still be locked down into the body, regardless of where the body sections are cut. Two are shipped standard inside of every body section

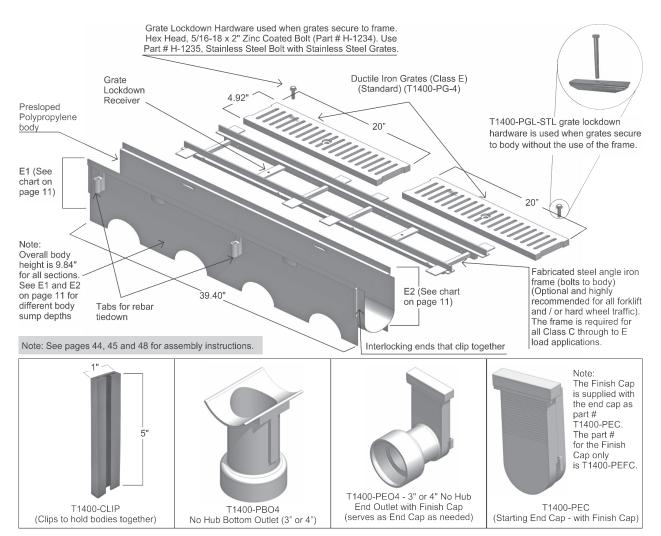

REBAR TIE DOWN CLIPS EVERY 20"

- Alternative method of securing body in the trench excavation during the concrete pour by gripping rebar. They are located every 20" to provide more rigidity during the concrete pour to prevent warping and rework

END AND BOTTOM OUTLETS - Snap into bodies quickly for fast installation.

EASY TO INSTALL CATCH BASINS -

The body sections snap directly into the catch basin. This eliminates the opportunity for a gap to develop between the catch basin and the body.

Design and dimensions are subject to modification. Prices do not include applicable taxes. Visit www.mifab.com for the most recent product information. MIFAB®, Inc., 1321 West 119th Street, Chicago, Illinois 60643-5109, USA

mation.

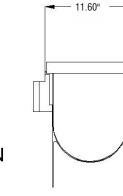

T2000 12" WIDE POLYPROPYLENE TRENCH DRAIN SYSTEM

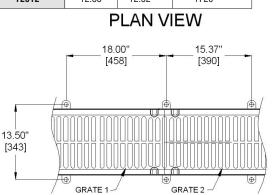

Specification: MIFAB Series T2000 wide pre-sloped trench drain system. Polypropylene drain body with integral top frame and 0.5% per section bottom slope, anchor flange with slotted tabs every 15.5" for rebar tie down and leveling, grate lockdown assembly, body support system, interlocking ends and radiused bottom. Standard with ANSI rated "Extra Heavy Duty" lacquered ductile iron grates and a galvanized steel frame with a safe live load of over 10,000 lbs. (Load Class C)

Function: Used in airports, car washes, malls and plazas, golf courses, factories and any other facilities that require large areas of surface drainage. Chemical resistant polypropylene material provides for long life.

TRENCH DRAINS

12" WIDE POLYPROPYLENE TRENCH DRAIN SYSTEM

MIFAB's 12" wide polypropylene trench drain bodies are 1 metre long (39.37") and are standard with a uniform exterior and 0.5% sloped or neutral (depending on the section number) interior with a full radius bottom for efficient liquid drainage. Drainage options include bottom outlet, end outlet or catch basin. Bottom and end outlet fittings in PVC material are available in 4", 6" or 8" (8" available in fabricated steel) diameter. They are also available in the same diameter in polypropylene material where chemical resistance is required. The end fittings fit all bodies and can be field trimmed to the required height.

LEGS SUPPORT BODIES UPRIGHT.

MEASURING END CAP: Insert starting cap on most up-stream channel. Mark to top of frame and adjust down 1/4" for outline. (allows for 1/4" height of finish cap)

STARTING END CAP ASSEMBLY: Cut SC and apply appropriate sealant on grove area. Use spacer clip to clip starting end cap to channel.

OUTLET END CAP ASSEMBLY: Fix to downstream channel tongue. Mark to top of frame and adjust down 1/4" for outline. (allows 1/4" height of finish cap) Cut and apply appropriate sealant to tongue area and assemble to channel with T2000-CLIP.

T2000-CLIP

95

BOTTOM OUTLET POP (BO) ASSEMBLY:

Position bottom outlet on appropriate channel. Mark position and cut hole with 4" or 6" hole saw. Screw through channel skirt into boss area on bottom outlet to square prior to pour.

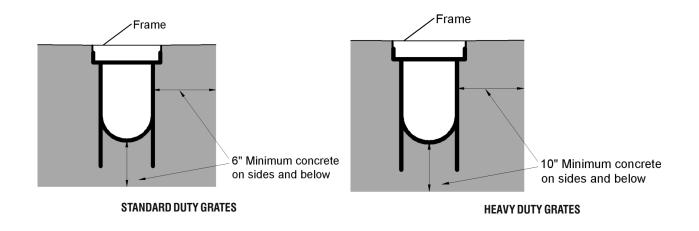

ASSEMBLE CHANNEL:

Layout with channel number visible upon completion of end cap assembly, begin assembling channels in sequential order. Apply appropriate sealant on tongue areas and clip channels together with quick clips. Once completed, move system into trench and slake with number 5 rebar or 3/8" all thread and level.

ASSEMBLY NOTE: Layout tench drain run in sequential order. Identify starting upstream and ending downstream channels and assemble starting end cap(s) and outlet end cap(s).

RECOMMENDED CONCRETE PLAN

GENERAL NOTES ON INSTALLATION: General installation requires frames to be in place and assembled in channels before/during cement pour. Defer to project engineer for any special requirements for channel installation. Diagram is for general purpose installations only.

(R)

SANITARY FLOOR AREA AND INDIRECT WASTE DRAINS

TOP

Available in round or square in a variety of sizes and materials, each of which allows maximum flow, sanitation and serviceability. See individual series for proper selection.

MEMBRANE CLAMP

Provided for applications in finished floors which incorporate a waterproofing membrane. Used to secure the membrane to the drain body, the flashing clamp provides a watertight seal at the drain.

BODY

Cast iron with A.R.E.coating inside giving a smooth finish which allows for easy drainage as well as increased sanitation. Easily cleaned because of the smooth finish. the drains are highly functional as well as aesthetically pleasing.

GRATE

Furnished A.R.E.-coated cast iron, stainless steel or nickel bronze. Each is ultimately designed for smooth flow into the drain body. Regularly furnished with a full grate, also available are half grate and three-quarter grates. (See page 98 bottom right corner for MIFAB's unique

3 in 1 nickel bronze and stainless steel floor sink design).

WEEPHOLES

Provided when the body is specified with a flange. Weepholes allow for the drainage of entrapped water which seeps down the outside/ of the body.

DOME STRAINER

Minimizes splashing as well as preventing debris from entering the drainage lines. The dome also allows for maximum water flow.

FLOOR SINKS

Visit www.mifab.com for the most recent product information.

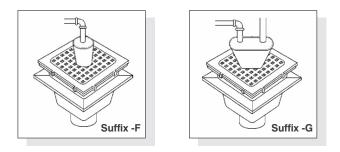

Design and dimensions are subject to modification. Prices do not include applicable taxes.

Toll Free: 1-800-465-2736 • Fax: 1-773-341-3049

MIFAB Sanitary Floor Area and Indirect Waste Drain Selection Guide

Sanitary floor sinks are used to receive surface drainage in areas where sanitation is a priority, such as institutional kitchens and hospitals and to drain indirect waste from various sinks, lavatories, condensate drains and other equipment. In order to specify the correct drain, the specifier must be aware of the floor sink's location and the type of equipment in the area to be served. While the round top will be compatible with most floors, a square top design is available for floor coverings with a square or straight -line pattern. Top sizes are 8" inches for normal usage and 12 inches for larger flow or where a greater free area is required. Stainless steel rims and grates are an excellent choice for traffic areas because of their qualities. Drop-in A.R.E. corrosion-resistant coated cast iron grates are available for nontraffic areas.

FUNNELS

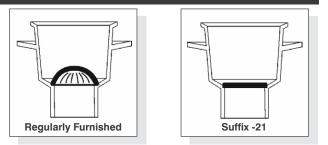

Funnels are used to prevent splashing of wastewater while the remaining free area receives surface drainage. A four inch round funnel is used for single drain lines. A six inch round funnel and nine inch oval funnel are used for multiple drain line discharge points. Specify suffix -F4 for 4" round funnel. Specify suffix -F6 for 6" round funnel. Specify suffix -G for 9" oval funnel.

BUCKETS

Sediment buckets are used when debris such as peelings, vegetable cuttings, bones, pits and other solid waste kitchen material is to be intercepted and retained. Specify suffix -5.

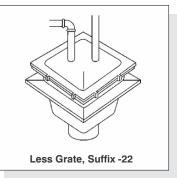

DOME AND INSIDE STRAINER

The regularly furnished dome not only minimizes splashing; it also prevents debris from entering drain lines. The dome also allows maximum water flow. If added protection is needed for the drain, an inside strainer can be specified along with a sediment bucket. Specify suffix -21.

GRATES AND COVERS

MIFAB sanitary floor sinks are regularly furnished with white A.R.E. coated cast iron grates. For high use areas it is advisable to consider the use of a Nickel Bronze or Stainless Steel frame and grate.

Specify suffix -1 for Nickel Bronze or -3 for Stainless Steel. Note that the -1 and / or -3 frame must be installed on top of the floor sink body before installation because the frame is mounted on top of the floor sink body and cannot be installed on top of the body after the body is installed flush to the floor.

A grate is not required for floor sinks installed in non traffic areas where indirect waste applications are usually applied. Specify suffix -22 for Less Grate. In areas such as frozen food cases or vegetable or meat cases; part of the floor sink may be covered and part left open to receive waste. Specify suffix -150 for half grate or suffix -175 for three-guarter grate.

MIFAB's patented (U.S. patent # 9,458,616) -1 and -3 floor sink frame and grate design is always shipped as a full grate. The installer has the option to remove either one guarter of the grate (to achieve a three quarter grate) or two guarters of the grate (to achieve a half grate). This provides maximum flexibility and choice during the installation process.

Design and dimensions are subject to modification. Prices do not include applicable taxes. Visit www.mifab.com for the most recent product information.

MIFAB Transition Floor Sink Information

MIFAB offers our Floor Sink bodies with transition outlet connections. Transition outlet floor sink bodies allow the installer to use any A1 body in order to attain the outlet connection size and type required (limited only to the outlet size and type of the A1 bodies).

A gasket (part # A3-PG) is installed between the transition floor sink body and the top of the A1 body in order to attain a watertight seal. The A1 body is screwed tightly onto the 4" NPSM male threaded transition connection of the floor sink body . The A1 body has the -7 trap seal primer connection as standard. The height of the transition bodies are increased slightly because of the A1 body. See table below:

How to order in parts: Transition bodies are identified within the MIFAB Kwik Order system by a T after the connection size. For example: FS1720T-PB (is the transition floor sink body only). A3-PG is the gasket required and the A1 body to stock in components.

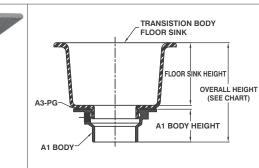

How to order an assembled transition floor sink:

Select the required floor sink body size and type and then the applicable connection size and type.

For example: FS1723TBP-FL-150 indicates a 3" push on outlet connection, with anchor flange and half grate.

MPB-2019-USA

R1200

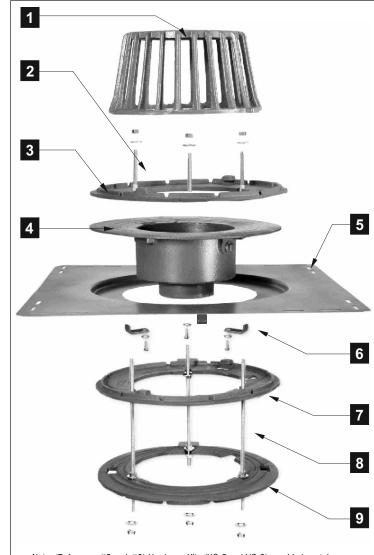

ROOF DRAINS

114

ROOF DRAIN COMMON PARTS

R1200

- 1. Dome strainer. 7 ½" high. Cast iron part # A2-MD illustrated (suffix -M). Standard dome receiver is the A2-PD polydome. Manufactured with 125 Sq. inches of free area. Dome receiver is also available in a low profile aluminum design (part #A2-MDL-80, suffix -M-80), in a low profile rough bronze design (part # A2-MDL-81, suffix -81) and in a low profile aluminum design with stainless steel mesh screen assembled around the dome strainer (part # A2-SSD, suffix -83). All of the low profile dome strainers are 4 1/2" high. All of MIFAB's roof domes are engineered to lock underneath the tabs in the A2-C3 dome receiver for a secure fit. Specify suffix -6 to vandal proof secure any of the dome strainers to the A2-C3 dome receiver.
- 2. HS-2 hardware pack. 5/16" threaded rods, nuts and washers are required to assemble the A2-C3 dome receiver and membrane clamp to the A2 roof drain body.
- 3. A2-C3 dome receiver and membrane clamp. Serves to secure the roof dome to the assembly and also to clamp the waterproofing membrane to the top flange of the A2 roof drain body. Raised grooves on the underside of the A2-C3 match the recessed grooves in the top flange of the A2 body to ensure a sealing grip onto the waterproofing membrane.
- 4. A2 body. Designed with a 15" diameter flange and a narrower and deeper sump than any JaSaWaZ body to: a) allow the contractor to cut a smaller diameter penetration in the roof (to better maintain the structural integrity of the roof), b) provide more efficient drainage of water since the head pressure in the deep sump of the body when filled with water is greater than in a shallower sump and c) narrower diameter sump requires only three sets of hardware to secure the membrane clamp to the body, thereby saving the contractor 33% installation time compared to any JaSaWaZ roof drain. MIFAB's A2 bodies are available with no hub, push on, threaded, inside caulk, PVC, ABS and stainless steel outlet connections.
- 5. A2-BP bearing pan (sump receiver). Manufactured with galvanized steel and painted with a finish. Engineered to recess the top flange of the A2 body into the roof deck to ensure easy flow of water from the roof deck into the sump of the roof drain (suffix -B). Securing slots in each corner permit easy assembly to the roof deck. Shipped one piece per carton for easy handling in warehouses and on the jobsite.

Note: (Reference #2 and #8) Hardware Kits (HS-2 and HS-3) provided contain standard 5/16" all threaded studs. Upon installation, excess rod may be cut to desired length for clean installation.

The bearing pan should be specified with every roof drain to ensure a correct recessed installation of the roof drain into the roof deck unless the roof drain is required with an adjustable extension. In this case, the roof drain body is elevated off the deck, thereby eliminating the need for a bearing pan. This is a large cost savings compared to JaSaWaZ since their roof drain extension system always has the roof drain body installed into the deck, always requiring the use of the bearing pan.

- 6. HS-20 hardware pack. Three cast iron painted securing brackets, nuts and washers are shipped standard (no extra charge) packed inside every A2-BP carton. Designed to allow the contractor to assemble the bolts into the tappings on the underside of the A2 body flange, securing the A2-BP to the underside of the A2 body flange with the three cast iron brackets at the same time. The result is a roof drain secured to the A2-BP and also to the roof deck. This can eliminate the costly underdeck clamp and also the labor required to install the underdeck clamp
- 7. A2-C3 adjustable extension ring. Installed on top of the roof deck. It is designed to elevate the roof drain body off the deck via the HS-3 hardware to accommodate the thickness of the insulation installed on top of the roof deck. This eliminates the use of any gaskets and o-rings (as required with the JaSaWaZ extension systems) that can cause leaks as the contrasting winter and summer weather causes expansion and contraction of gaskets and orings. Labor savings are also realized by the contractor with the simple MIFAB adjustable extension system (suffix -E).
- 8. HS-3 hardware pack. 5/16" threaded rods, nuts and washers are required to elevate the roof drain body off the deck to accommodate the thickness of the insulation installed on top of the roof deck. The HS-3 hardware threads into the tappings on the underside of the roof drain body.
- 9. A2-C3 underdeck clamp. It is installed underneath the roof deck and is engineered to "lock" the roof drain assembly into the roof deck, thereby reducing pipe vibration and potential damage. Can be eliminated when the MIFAB A2-BP sump receiver is installed with the unique HS-20 hardware pack as described above in point #6. (suffix -U).

Design and dimensions are subject to modification. Prices do not include applicable taxes.

Roof Guard

POLYETHYLENE ROOFGUARD

MAKE ROOF DRAINS UNCLOGGABLE

APPLICATIONS:

* Ideal to replace existing roof drain domes on the roofs of schools, warehouses, factories, office buildings and any other building that has standing water on the roof due to clogged roof drain domes.

RoofGuard ELIMINATES STANDING WATER:

- Patented design increases surface area by up to 5x or more making a RoofGuard protected drain virtually uncloggable. RoofGuard SAVES \$\$
- RoofGuard works 24/7.
- Eliminates leaks and costly repairs caused by clogged drains.
- RoofGuard will replace any Roof Drain Dome Strainer up to 15" in diameter.
- Installation is fast, simple, and requires no tools.
- Removable Top allows easy access to drain and piping without detaching RoofGuard. **INSTALL IT:**
- Clean and remove all dirt, debris, and other loose material in area around the drain where RoofGuard is to be installed. After cleaning, if the area is wet dry it off removing as much moisture as possible.
- Remove and dispose of current drain dome strainer.
- Turn RoofGuard over and fill the Attachment Pods with an exterior adhesive such as Chemlink M-1 or equal. Make sure the Pods are completely full and over flowing with adhesive to properly bond.
- Turn RoofGuard over to install over the drain. Press firmly on top of the Attachment Pods to ensure good adhesion to the roof surface.

See Page 139 for complete roof drains with the RoofGuard

See the current RoofGuard booklet for List Prices and discount structure for the RoofGuard products

DUCTILE IRON ROOFGUARD

In applications where a ductile iron RoofGuard is preferred, MIFAB's model number RG2016DDC ductile iron RoofGuard is ideal.

APPLICATIONS:

*Ideal to replace existing roof drain domes on the roofs of schools, warehouses, factories, office buildings and any other building that has standing water on the roof due to clogged roof drain domes. The ductile iron RoofGuard ensures a long life. It is also positively bolted to the roof drain body and membrane clamp.

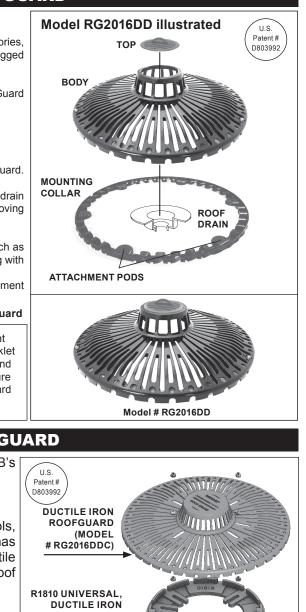

INSTRUCTIONS:

- Remove the existing roof drain dome and membrane clamp.
- Place the MIFAB R1810 cast iron universal membrane clamp ring onto the top of the existing MIFAB, Zurn, JR Smith, Wade, Josam or Watts body - taking care to ensure that the roof membrane is secured between the body and the universal membrane clamp. The universal design of the R1810 ensures that it will line up with the female threaded tappings of the existing ductile iron drain body.
- Use the MIFAB HS-19 hardware to bolt the R1810 to the top of the existing cast iron drain body. Note that the HS-18 hardware is required when assembling the ductile iron RoofGuard to the MIFAB A2 drain body.
- Place the cast iron RoofGuard (Model # RG2016DDC) onto the top of the R1810 universal clamp ring. Use the HS-19 hardware pack to secure the ductile iron RoofGuard to the R1810 universal membrane clamp.

US Patent # D803992 DUCTILE IRON ROOFGUARD (MODEL # RG2016DDC) **R1810 UNIVERSAL**, DUCTILE IRON MEMBRANE CLAMP ZURN, JR SMITH, WADE, JOSAM. WATTS OR MIFAB CAST IRON DRAIN BODY HS-19 HARDWARE NOTE THAT THE HS-18 HARDWARE IS REQUIRED WHEN USING THE MIFAB A2 DRAIN BODY. **DUCTILE IRON** ROOFGUARD BOLTED TO **THE R1810** MEMBRANE CLAMP AND THE JaSaWaZ ROOF DRAIN BODY

MIFAB Roof Drain Selection Guide

The object of equipping a roof drain with an adjustable top via its adjustable extension is to place the top or inlet of the drain at the right heiaht above structural deck level to accommodate various thicknesses of insulation. This avoids the necessity of tapering or feathering the insulation layer down to the fixed body flange level of the drain causing a loss of insulation value at the drain location. MIFAB ACCOMPLISHES THE ADJUSTMENT BY INSTALLING A DECK FLANGE ONTO THE ROOF DECK AND SUPPORTING THE ROOF DRAIN BODY FLUSH OR SLIGHTLY BELOW THE MEMBRANE LEVEL (ABOVE THE INSULATION) UTILIZING THE HS-3 HARDWARE SET. A DECK CLAMP (SUFFIX -U) IS SECURED BENEATH THE DECK ON THE SAME HARDWARE TO ENSURE A RIGID INSTALLATION. IN ALL CASES, THERE IS NO USE OF GASKETS OR MASTIC COATINGS. THIS PRECLUDES THE POSSIBILITY OF ANY LEAKAGE DUE TO BACK-UP IN THE DRAINAGE SYSTEM AS A RESULT OF SURCHARGE OR BLOCKAGE.

On Promenade decks, a collar with a cam provides finite adjustment, with the collar being secured by three locking screws to the body of the roof drain. A similar system is used with the R1200-HC in IRMA (Inverted Membrane) systems. You do achieve the precise height with MIFAB roof drains with a minimum of effort. Moreover, MIFAB roof drains provide flexibility in top height often necessary to overcome construction irregularities impossible to compensate for with fixed extension drains.

LOCKING DOME

ROOF DRAINS

Once in place stays in place to provide positive protection for the roof drain and drainage system entrance. The vertical perimeter openings provide sufficient free drainage area, in compliance with codes and standards, for prompt and efficient drainage of the roof while protecting the system against entrance of potentially damaging objects. With the open or free area on top, which is merely for flood conditions, the dome has a total free area in excess of 125 square inches.

ADJUSTABLE EXTENSION DECK FLANGE (SUFFIX -E)

Adjustable extension is placed on the structural deck level to accommodate various thicknesses of insulation, thereby avoiding the necessity of tapering or feathering the insulation layer down to the fixed body flange level of the drain causing a loss of insulation value at the drain location. MIFAB accomplishes the adjustment by installing a deck flange onto the roof deck and supporting the roof drain body flush or slightly below the membrane level (above the insulation) utilizing the HS-3 hardware set. A Deck clamp (suffix -U) is secured beneath the deck on the same hardware to ensure a rigid installation.

COMBINED FLASHING CLAMP AND GRAVEL STOP

Features a broad clamping area with ridges that match grooves in the flange of the roof drain body to secure the membrane without the puncturing and troublesome wrinkling often encountered with so-called locking type clamps. The vertical gravel stop prevents rooftop surfacing gravel from washing into the drainage system while permitting drainage of roof through the V-type weirs.

ROOF

MEMBRANE

R1200-EU (ILLUSTRATED) BODY

NSULATION

DECK

This basic component made of cast gray iron of commercial drainage fitting quality features a wide top entrance and support flange with large contoured deep sump for optimum flow of water into the roof drainage system.

UNDERDECK CLAMP (SUFFIX -U)

Serves to unite roof drain and roof deck in a common bond through a viselike compression principle that assures a positive permanent installation. The deck is sandwiched between the drain flange, or sump receiver and the underdeck clamp to preclude membrane or flashing rupture that could occur if the underdeck clamp is not utilized.

MIFAB Roof Drain Selection Guide (Cont'd)

Roof drains and accessories combine to form the upstream or entrance terminals of the roof drainage system and as such play a key role in the success or failure of the system. Sizing and placement of roof drains are thoroughly covered in the next section of this catalog. However, prior to sizing and placement of drains, there are certain basic roof design factors that must be considered when selecting and specifying the proper roof drains and accessories for the job. Even though all roofs serve the same basic purpose of protecting the building and its contents from the elements, their design, composition, construction and drainage requirements do vary. Accordingly, when the specifications for the roof drains and accessories are developed, it is of vital importance that all design factors of the roof be addressed and reflected in the products specified to ensure a trouble free, successful installation. Also, insistence upon compliance with the specifications is essential, for departure there could result in a substandard roof drain installation potentially doomed to ultimate failure. Basic roof design factors for consideration with recommended drainage products follow.

ROOF DECKS

ROOF DRAIN SUPPORT SUMP RECEIVERS

Roof decks, owing to the broad range of types and materials of construction, provide perhaps the greatest challenge to the specifier in his quest for the proper method of roof drain support for installation in a given deck. Unless the drain is

being installed in a poured concrete deck with drain in place completely surrounded and supported by the deck it will be necessary to provide a deck opening in which to set the drain. It is when such openings are required that drain

support becomes the foremost consideration. Even though minimum deck openings are recommended in this catalog for each drain and maximum openings are stated based on the

drain's outside sump diameter, maintenance of the actual opening size within the range cannot always be assured. Therefore, a sump receiver, sometimes called drain receiver should be specified with the drain to compensate for deck opening irregularities and provide proper support for the drain. The sump receiver is simply a thin steel ring with a wide, flat flange and depressed center opening into which the roof drain body flange fits, supported by the lip of the opening. In addition to easing the deck opening tolerance requirements, the sump receiver helps to distribute the weight of the drain over a broader surface of the deck. By placing the top of the drain flange at deck level where it should be, the sump receiver helps to avoid the dam-like effect created when the drain flange rests on top of the deck opening. Specify Suffix –B

ROOF DECKS

ROOF DRAIN SECURING UNDERDECK CLAMPS

Proper roof drain support having been resolved through employment of the sump receiver, it becomes necessary to consider a practical method of securing the drain to the deck. If the drain is not in a "poured-in-place," thus secured, installation of an auxiliary securing means must be provided. The most effective and positive means available in response to this requirement is

the underdeck clamp (suffix -U). With the drain in place and the sump receiver on top of the deck, the underdeck clamp of circular configuration, surrounding the drain and connected piping, is brought to bear

against the bottom of the deck and drawn tightly in place with hardware provided. This in effect sandwiches the deck into a positive union with the drain. Thus secured into place, the roof drain becomes an integral component of the deck with assurance of installation stability and optimum performance in its role as entrance terminal of the roof drainage system. **Specify Suffix –U**

<u>* MIFAB</u>

MIFAB Roof Drain Selection Guide (Cont'd)

ROOF DECKS

EXPANSION AND CONTRACTION EXPANSION JOINTS

Expansion and contraction, primarily caused by alternating hot and cold environmental conditions, are of particular concern with roof decks and topping materials. Accordingly, these opposing reactions are compensated for in the roof structure by strategically located expansion joints which yield to maintain integrity of the roofing system. Equally important in the preservation of integrity of the roofing system is the roof drain's connection to the drainage piping system. This must permit the drain, an integral component of the roof, to move with the roof during the expansion and contraction process without rupture of either the connection or the watertight bond of drain to roof. In response to this requirement, horizontal offsets in leader piping immediately below the drain connection, which provide a swing joint effect, are employed as are in some cases a side outlet. When bottom outlet roof drains are selected, flexible expansion joints should be used to compensate for expansion and contraction of the roof if the leader cannot be horizontally offset. Specify Series **R1900 Vertical Expansion Joints.**

ROOF DRAINS APPLIED INSULATION ROOF DRAINS WITH ADJUSTABLE EXTENSION (DECK FLANGE)

The insulation layer, which is normally applied over the structural deck, merits consideration in the selection and specification of the roof drains.

A common practice has been to feather or taper the insulation layer down to meet the drain top at the structural deck level. This creates a sump surrounding the drain into which roof topping materials are brought for bonding with the drain

flange by means of the flashing clamp. Such sumps, or roof depressions at the drains, even though favored by some designers for their positive drainage aspects, have a downside as receptacles for debris with adverse effects to drainage and potential premature failure of the

drain-roof bond. To avoid these potential problems, an adjustable extension is placed on the structural deck level to accommodate various thicknesses of insulation. This avoids the necessity of tapering or feathering the insulation layer down to the fixed body flange level of the drain causing a loss of insulation value at the drain location. MIFAB accomplishes the adjustment by installing a deck flange and supporting the roof drain body flush or slightly below the membrane level utilizing the HS-3 hardware set.

Specify Suffix -E.

PARAPETS

ROOF PERIMETER PROJECTIONS DRAINAGE

Parapets, normally building outer wall projections above roof elevation, serve important functions in building structure and architectural aesthetics. Parapets also act as barriers against water being swept off the roof during storms, a potentially hazardous condition to passersby and to the building walls themselves. However as an adjunct to the primary roof drainage system, drainage through the parapets at their roof level base or at a predetermined overflow elevation through proper drains or scuppers is recommended, for parapet base-roof level drainage. Specify Series R1300 or R1320 and for overflow drainage specify Series R1940.

ROOF DECKS (IRMA)

INSULATED MEMBRANE ROOF DRAINS WITH EXTENSION BALLAST GUARD

The increased popularity of insulated roof assembly (IRMA) membrane type roof construction, sometimes referred to as inverted roof construction (because the membrane is under the insulation layer) has led to the development of roof drains equipped with ballast guards. The primary object of insulating the membrane is to protect it from damaging weather conditions thereby prolonging its integrity . In the insulated roof membrane assembly, the waterproof membrane is applied directly to the structural deck surface. Then specially designed insulation planks with drainage grooves are set in place on top of the membrane. Above this, a percolation layer of aggregate gravel is applied to secure the insulation, while permitting efficient

118

Design and dimensions are subject to modification. Prices do not include applicable taxes.

MIFAB®, Inc., 1321 West 119th Street, Chicago, Illinois 60643-5109, USA All sales subject to MIFAB's® Terms and Warranties. Please refer to inside front cover. sales@mifab.com • Canada Toll Free: 1-800-387-3880

MIFAB Roof Drain Selection Guide (Cont'd)

drainage away from the surface. With this arrangement of layers, rainfall quickly percolates through the gravel to the surface of the insulation layer from where over 90 percent gravitates to the roof drain and the balance finds its way between the insulation planks via the grooves to the roof drain. Thus with the bulk of the water arriving at the drain well above waterproof membrane elevation it is desirable to provide a ballast guard on the drain above structural deck level to screen out the undersized aggregate gravel that is carried through the gravel layer with the flowing water. Roof drains equipped with ballast guards are ideally suited for this application and should be specified for installation in all insulated roof membrane assembly type roofs. There are basically two schools of thought as to the proper location of the dome on ballast guard equipped roof drains. One suggests it be in its normal position assembled to the flashing clamp at structural deck level with the ballast guard surrounding

the dome making for a dome recessed drain assembly. The other option is to place the dome and its retaining ring on top of the ballast guard at the surface of the aggregate gravel layer. The decision as to which type to specify remains with the engineer, as either type will function satisfactorily for the purpose intended.

ROOF DECKS ROOF DRAINS WITH WATER DAM

Sometimes, roofs are designed to contain a predetermined amount, thus depth, of water at all times for various reasons. Roof drains for installation in such roofs are equipped with a watertight open top collar either internal or external of the dome, with its flood level at the prescribed elevation above deck to serve as a dam to retain and maintain the desired amount of water on the roof. Excess water, treated for drain sizing purposes as rainfall, floods over the dam and is discharged into the roof drainage system in the normal manner. Specify suffix –R or -W.

ROOF DECKS OVERFLOW DRAINAGE

Most codes require that an overflow system be installed in the event of a blockage or surcharge of the main storm drain system. This may be accomplished by installation of scupper drains (R1300T) with downspout nozzles (R1940). Another method to meet the code requirement is install a completely separate roof drain with external water dams (R1200-R) or internal standpipes (R1200-W). MIFAB has also developed a combination primary and secondary roof drain in one unit requiring a single deck opening. Specify R1150 Series or R1270 Series.

ROOF DECKS GUTTER AND BALCONY DRAINAGE GUTTER DRAINS

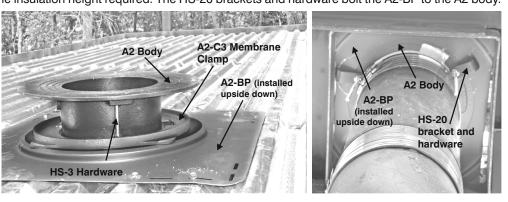

Drainage requirements for gutter and small roof areas, such as balconies and the like, are handled by small compact roof drains referred to as gutter drains. Such drains, owing to their

compact size, can readily be installed in confined locations which otherwise may not be properly drained. Specify Series R1400 through R1420.

ROOF DRAIN EXTENSION SYSTEM – WITH BODY ON TOP OF DECK

The typical MIFAB roof drain extension system is made with the –EU suffix (see pages 118 and 119 for an overview of this). Some contractors prefer to adjust the A2 body height above the deck with the A2-BP sump receiver (installed upside down) and the A2-C3 membrane clamp placed on top of the upside down A2-BP. The HS-3 hardware rods push the A2 body above the deck to the insulation height required. The HS-20 brackets and hardware bolt the A2-BP to the A2 body.

The HS-3 hardware rods are tightened to the HS-20 brackets with nuts and washers and extend up into the underside tappings of the A2 body flange. The benefit is that the entire system can be put together on the ground and then simply placed over the hole on the roof – saving labor.

MIFAB Rainfall Considerations for Roof Drains

Flat roof drainage is accomplished through a system of roof drains, vertical leaders, and horizontal storm drains sized and located in ccordance with established criteria in conformance with local plumbing and building codes. Therefore, when considering the design of a roof drainage system, it is recommended that local code authorities be consulted regarding the rainfall rate acceptable in their jurisdiction for design purposes. National rainfall rate information is provided in the chart below, listing rainfall rates in millimeters per hour for selected cities.

When the rainfall rate for the locale of the project has been resolved, sizing of the roof drains, leaders and horizontal drainage piping can proceed.

Rainfall Rates for Selected Cities (inches per hour)

Based on a storm of one hour duration and a 100 year return period. Source: Environment Canada-National Climate Data and Information Archive

Sizing and Placement of MIFAB Roof Drains

As a first step in the sizing procedure it will be necessary to determine the quantity and placement of the drains required for the roof. Even though there are a number of opinions regarding roof areas that can be effectively drained by one drain, it is recognized that for minimized ponding with adequate drainage, two roof drains are required for roof areas of 10,000 square feet or less, and at least one drain is required per 10,000 square feet of area for larger roofs. Individual judgement will be necessary when considering quantity and placement of drains on roofs where shape and size of sections may require departure from the 10,000 square feet per drain recommendation. In the replacement of drains, uniform distribution is desirable for proper roof drainage. Locating drains within 50 feet of the roof perimeter and no more than 100 feet apart is acceptable practice. Also, careful consideration of roof structural members, dividers, expansion joints, and other projections including rooftop equipment is essential in planning the roof drainage system for adequate drainage of each area of the roof. Consultation with the architect and structural engineer regarding roof details is recommended.

RAINFALL CONVERSION: INCHES PER HOUR TO GPM

For sizing purposes, rainfall-which is expressed in inches per hour, (in the following calculation) - is converted to gallons per minute per square foot of roof area. A one (1) inch per hour rainfall converts to .0104 GPM per square foot. For any given rainfall, multiply the inches per hour by .0104 to arrive at the GPM per square foot of roof area. Then multiply that figure by the square feet of roof area to be drained to arrive at the total gallons per minute to be handled by the drainage system. For example: consider a 4-inch per hour rainfall on a 10,000 square foot roof: **0.0104 x 4 x 10,000 = 416 GPM**

NOTE: Stated flow rates for roof drains are based on particular test piping configurations and dimensions. The effects of other piping configurations and dimensions on the actual system flow rate shall be evaluated by, and is the responsibility of, the system designer/engineer.

NOTE: For areas that follow the 2015 IPC, please refer to page 124 for additional roof drain sizing requirements.

Roof Drain Sizing: Other Considerations

OVERFLOW DRAINAGE

Overflow scuppers and drains, as essential components of the roverloading of roof structures. They must be installed in conformance with local codes. Generally, scuppers are installed in adjacent parapet walls no more than 5 inches above the low point of the roof at a ratio of at least one scupper per 20,000 sq. ft. of roof area. Overflow drains of the same size as the roof drains having above roof inlet elevation as specified by code, connected to drain lines independent from the roof drains, may be installed in lieu of scuppers. Roof drainage system, are employed to prevent potentially damaging.

VERTICAL WALLS

Finally, vertical walls that project above and permit storm water to drain on the roof area to be drained must be considered when planning the roof drainage system. An acceptable rule to follow in sizing roof drains, leaders, and horizontal drainage piping is to add one half of the area of any vertical wall that diverts rainwater to the roof to the projected area of that roof. By multiplying the area thus obtained by the GPM/sq. ft. conversion of inches per hour rainfall, the new total GPM discharge requirement is determined for the roof.

A2-BP-EU Roof Drain Extension System – With Body on top of Deck

The typical MIFAB roof drain extension system is made with the -EU suffix (see pages 118 and 119 for an overview of this). Some contractors prefer to adjust the A2 body height above the deck with the A2-BP-EU sump receiver. The A2-BP-EU is bolted to the top of the roof deck through the four slots in each corner of the A2-BP-EU. The HS-3 all thread rods are connected to the top, raised center part of the A2-BP-EU with nuts and washers provided within the HS-3 hardware pack and then can be adjusted to extend the A2 body above the roof deck to accommodate the insulation thickness. The HS-3 threads into tapped bosses that are located on the underside of the A2 body flange. The advantage of using the A2-BP-EU system is that all adjustments to meet the insulation thickness are made above the roof deck. Also, there is no need for an underdeck clamp because the A2-BP-EU is bolted to the roof deck and the A2 body is securely bolted to the top of the A2-BP-EU. The List Price of the A2-BP-EU is \$343.00. The HS-3 hardware pack is not included and needs to be ordered separately.

MIFAB Roof Drain Selection Guide (Cont'd)

ROOF DECKS VENT STACKS VENT CAPS

Even though vent stack and stack vent terminals extending above roof deck level are components of the sanitary drainage system of the building, they are included for consideration in this section because of roof penetration and roof level maintenance requirements. Vents maintain the air-hydraulic balance of the building's sanitary drainage system and in serving that purpose must be maintained open for positive circulation; i.e., the escape of gas and intake of fresh air. Because of the vent terminals exposure to the elements above the roof, it is vulnerable to fouling by various means-leaves, twigs, bird nests, etc., that somehow have a tendency to become lodged therein. To preclude this undesirable condition protective vent caps that permit free circulation of air while protecting the vent terminal against fouling are recommended. Specify Series R1940.

ROOF DECKS VANDALISM VANDAL PROOFING

Because of their "out of building" rooftop location, the exposed components of the roof drainage system, particularly roof drain domes and grates, are subject to vandalism. This is especially true on roofs having easy access. Domes are occasionally removed and at times flung over the roof edge to the detriment of any unfortunate person below. Also, drains congested with debris are rendered useless. To avoid these unlawful damaging circumstances, vandal proofing of roof drain domes and grates is recommended. Vandal proofing is accomplished by securing these components to their fixed mating parts with vandal proof screws or bolts which require special tools, available only to authorized maintenance personnel, for application and removal. Specify Suffix -6.

Introduction Controlled Flow Roof Drainage

In the early 1960's, the pervasive industrialization of the post war boom lead to a new problem for plumbing engineers. As more industrial parks, malls, entertainment facilities, factories and warehousing were built, the load on the local storm sewer system due to extensive paved areas surrounding these buildings for parking as well as their own extensive square footage of roof created an unprecedented demand. Where rain once fell on undeveloped land, and was subsequently absorbed or abated by natural drainage, it now fell on pavement, where no absorption factor meant the total rainfall for vast new areas now had to be conducted by municipal storm sewer systems. To avoid overtaxing the local systems, engineers began to be design flat roofs with controlled flow roof drains. Instead of just getting rid of the rain as fast as it fell, the idea was conceived of using the roof itself as a reservoir from which water could be drained off gradually after a storm abated, thus sparing the storm sewer from being overwhelmed. Roofs could then be built with 6" parapets to not only store the rainwater, but also act as wind break against miniature waves that might be caused on the reservoir in high winds with consequent spillage. On buildings with greater than 6" parapets, scupper drains had to be installed at the 5" level to guard against overloading should the drain system fail.

The Heart of the Controlled Flow Roof Drainage System, The Accuflow Weir

In order to use the roof as a reservoir twas necessary to design a system where the rate of flow was easily determined for any possible rainfall conditions. The problem is that the rate of flow naturally varies exponentially with the depth of stored water on the roof (a.k.a. head pressure). This made the calculations necessary to design a roof top rain storage system very difficult. The answer was to design a flow control weir with a parabolic opening which would make the flow off the roof linear instead of exponential. This meant that once a constant linear flow rate was

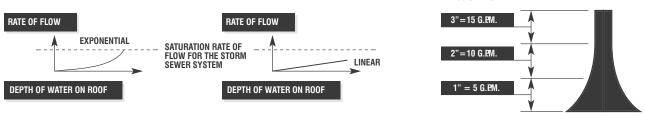

decided, a weir was designed to admit water to the system at only this fixed rate. The MIFAB system uses a fixed rate of 5 U.S. G.P.M. per inch of water.

ROOF DRAINS

ACCUFLOW CONTROLLED FLOW ROOF DRAIN SYSTEM

IN AN UNREGULATED SYSTEM, FLOW IS EXPONENTIALLY PROPORTIONAL TO DEPTH OF RAINWATER ON THE ROOF, AND QUICKLY REACHES THE SATURATION POINT OF THE SYSTEM. IN A CONTROLLED SYSTEM, FLOW IS LINEARLY PROPORTIONAL TO DEPTH OF RAINWATER ON THE ROOF AND GRADUALLY DRAINS WITHOUT OVERLOADING THE STORM SEWER SYSTEM. THE SPECIALLY DESIGNED PARABOLIC OPENING OF THE ACCUTROL WEIR CREATES A CONSTANT FLOW OF RAINWATER THAT INCREASES PROPORTIONATELY AT A RATE OF 5 GPM PER INCH OF STANDING WATER UP TO 30GPM ON THE R1200 SERIES AND 15 GPM ON THE R1100 SERIES.

Controlled Flow Roof Drainage: Design Considerations.

Three main considerations must guide the design of a controlled flow roof drainage system:

- 1. It must drain quickly enough to avoid the weight of water building to the point of being an architectural hazard.
- 2. It must drain slowly enough to prevent overloading the sewage system with the consequent risk of flooding or pollution or both.
- 3. It must drain down in a reasonable time to minimize the risk of freezing in low temperatures. To meet these requirements, regional rainfall values had to be carefully considered. From these values, it is possible to calculate the number of gallons per minute (GPM) need to be drained to ensure the buildup in the worst conditions did not exceed a depth of three inches. The consideration of the worst conditions had to be determined from government statistics. The figures used were compiled by the Meteorological Branch of the Department of Transport. The information was combined to produce values that would predict the worst conditions that one could expect over a period of time, in this case ten, twenty-five and fifty years. Hence the expression, "ten year rain" or "fifty year rain".

As well, there are also the local building codes, which specify drain down time (in hours) and maximum head of water on the roof in inches. The maximum drain down time has been determined to be 30 hours to eliminate the possibility of freezing. A constant rate of flow makes it possible, with the use of our Area Selection Table, to quickly determine the number of drains needed for any size of roof where this value is known.

Controlled Flow Roof Drainage:Factors that can effect Roof Drain Sizing & Position.

Where a roof area is surrounded by vertical walls, some consideration must be given to the volume of rainwater that these walls might add to the total volume to be drained under "driving rain" conditions:

- 1. One wall: Add 50% of wall area
- 2. Two walls:Add 35% of wall area
- 3. Two walls opposite of differing heights:Add 50% of the difference in wall area of that part which extends above the lower wall.
- 4. Walls on three sides: Add 50% of the inner wall area above the top of the lowest wall(s).

Other Factors to consider:

- 5. Drains should be located with preference to the downwind side of the roof. In a storm, it is not uncommon for the rainwater level to differ significantly from one side to another due to the effects of high winds.
- 6. Drains should not be located at columns or other high spots.
- 7. Rooftop mechanical equipment shall be installed with proper allowances for the "ponding" a control flow roof drain system will create.
- Parapets should be high enough to prevent spillage or worse, for in winter there is the danger of ice or snow blowing off the road that must be considered.

Controlled Flow Roof Drainage: Sizing Procedure.

- A Determine the roof area(s) (individual areas when the roof is divided by expansion joints, parapet walls, control joints, etc.) to be drained making the allowances for any of the factors (above) which may effect the total square footage of the roof.
- **B** Follow the location and placement guidelines for conventional roof drains as found on the next pages (viii & ix), allowing no more than 50 ft. from an edge, no more than 100 ft. apart, and a maximum square footage of 10,000 per drain, etc.
- C Calculate the number of weirs. Divide the total square footage by the area factor for the location of the roof. If the number of weirs is greater than the number of drains from **step B**, add 2-slot weirs to roof drains as necessary, starting with the drains closest to the downwind edges of the roof. If the number of weirs is fractional, round up. If the number of weirs is less than the number of drains, every drain should still be equipped with a one slot weir.
- **D** Based on the slope and area to be drained by each weir, the maximum flow from all the drains on the roof can be added together to determine vertical leader sizing and horizontal storm sewer requirements.

New IPC Roof Drain Sizing Requirements

The 2015 IPC (International Plumbing Code) states in Section 1105.2 that "published roof drain flow rate... shall be used to size the storm drainage system... in accordance to Section 1106."

Section 1106 references the ASME Roof Drain Standard A112.6.4. Section 7.2 of A112.6.4 (Flow Testing) states that "To determine the flow rate entering the drain at a 2" water depth."

The IPC is followed by many states that do not use the IAPMO UPC Plumbing Code.

This has caused some confusion for plumbing engineers that specify roof drains. It is a change in how roof drainage is to be sized.

Below is a common question from the plumbing engineering community:

"In the new 2015 International Plumbing Code (IPC), paragraph 1105.2, it now states that in order for plumbing designers/engineers to size roof drains and associated storm drainage piping, we are to use published roof drain flows in conjunction with the IPC Section 1106.

"Does Mifab have flow rates for their roof drains that can be shared and are these flow rates based on drain opening size?"

Yes, MIFAB does. Below are the published MIFAB R1200 Roof Drain Flow Rate test results. The testing on the MIFAB R1200 Roof Drains was done by NSF per ASPE / IAPMO / ANSI Z1034 test procedure

Model #R1202	Head	1"	2"	3"	4"	5"	6"

6" Cast Iron Drain with Cast Iron Dome	GPM	15	75	210	250	490	715

Note: MIFAB's stated flow rates for roof drains are based on particular test piping configurations and dimensions. The effects of other piping configurations and dimensions on the actual system flow rate shall be evaluated by, and is the responsibility of, the system designer/engineer.

QUICK GUIDE TO GENERAL ROOF DRAIN SIZING

CHARTS A and B

As an aid to the sizing and placement of MIFAB roof drains, please refer to Charts A and B, which give leader and horizontal storm drain capacities at various slopes, with capacities in GPM and maximum projected roof areas in square feet in each case. It will be noted that a 6-inch leader, thus 6-inch drain, will be indicated by the preceding example. The horizontal storm drain required, depending on slope, would be 6 or 8 inch. However, remembering that two drains are recommended for areas of 10,000 square feet or less, it would be advisable to select smaller drains with total capacity of 416 GPM or more. The maximum projected roof areas in Charts A and B are based on the flow capacity of each pipe size shown. The total of the projected flows from the vertical leaders will determine the size and slope of the horizontal storm sewer required in chart B.

CHART A:

Vertical leader capacity in GPM with maximum serviceable roof area in square feet based on various anticipated hourly rainfall rates.

VERTICAL LEADER SIZ Rainfall inches cai Per hour	-	ROOF AREA Square feet 1	ROOF AREA Square Feet 2	ROOF AREA Square feet 3	ROOF AREA Square feet 4	ROOF AREA Square feet 5	ROOF AREA Square feet 6

ROOF DRAIN SIZING - EXAMPLE

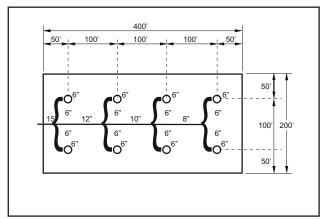

A warehouse is being built in a geographical area where the maximum hourly rainfall (from rainfall map) is 2.8 inches per hour. The building will be 200' x 400' and have a flat roof with no appreciable vertical surface.

CALCULATIONS:

- Total area to be drained (200 x 400) 80.000 Sa. ft. Number of drains required
- (From sizing rule, one drain per 10,000 sg. Ft)
- Rainfall conversion from in. per hour GPM 2330 (0.0104 x 2.8 x 80,000)
- Expected flow from drain 292 (GPM \div number of drains) (2330 \div 8)
- Size of leader (from Chart A) 6 inch vertical
- Size of horizontal storm sewers (from Chart B 1/4/ foot slope, combined flow of vertical leaders 8,10,12,15, inches

Roof Drainage System Layout indicated by the sizing example.

Note: For areas that follow the 2015 IPC, please refer to page 124 for additional roof drain sizing requirements.

HYDROMAX[™] SIPHONIC ROOF DRAINS

INTRODUCTION

MIFAB[®] has taken the leadership in providing superior siphonic drainage solutions specifically engineered for the U.S., Canada and Mexico markets. Siphonic roof drainage solutions have been successfully used for nearly 50 years. The Mifab[®] HYDROMAX[™] siphonic solutions are based on the latest ASPE/ANSI 45 Standard and with hundreds of HYDROMAX[™] projects using many thousands of HYDROMAX[™] siphonic roof drains tested to ASME/ANSI A112.6.9:2005 drain standard with IAPMO listing. The MIFAB HYDROMAX siphonic solutions are compliant with the latest IPC Chapter 11 requirements.

Design and dimensions are subject to modification. Prices do not include applicable taxes. Visit www.mifab.com for the most recent product information.

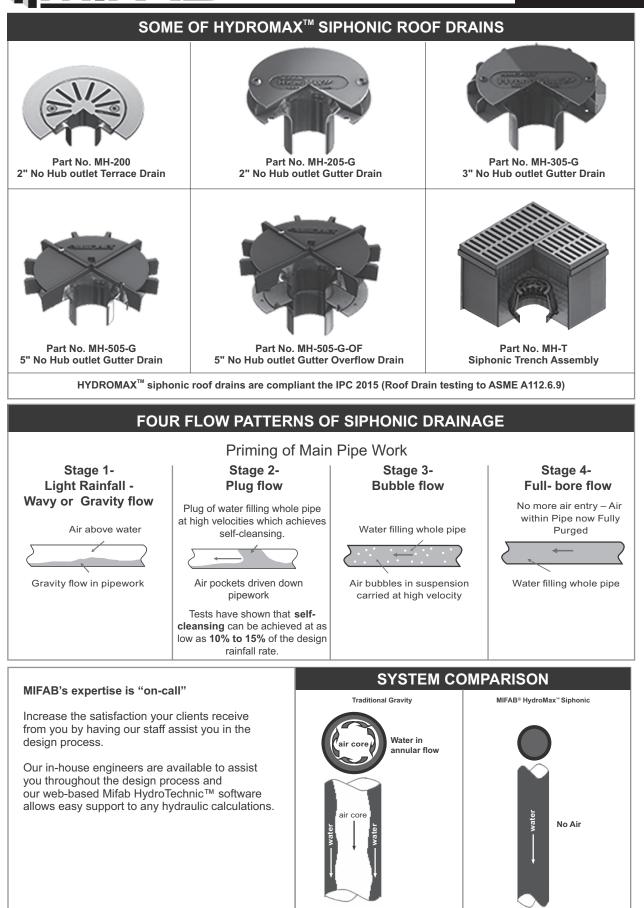

The MIFAB HYDROMAX siphonic roof drain system is designed to have high flow capacities while minimizing ponding. Mifab's unique system prevents air ingress into the pipework, combined with a hydraulically designed pipe system, allows for high performance siphonic flows. The advanced Mifab[®] HydroTechnic[™] online analytical design calculation software program which has been independently tested for full

► MIFABROOF DRAINS

Benefits of incorporating a MIFAB[®] HYDROMAX[™] Siphonic Roof Drain System

- Cost savings of 25 to 45%
 - Smaller Pipe Size
- Horizontal pipes installed flat, no slope means substantial space savings. Labor savings
- Less ponding
- IPC 2018 compliant All MIFAB[®] HYDROMAX[™] drains have ponding graphs GPM of drain from testing to ASME A112.6.9
- Ideal for primary & secondary overflow roof drainage
- Flexibility in routing frees up building space.
- Eliminate trenching under building floor.

In order to correctly design a Mifab[®] HYDROMAX[™] Siphonic roof drain system the following information is needed:

- 1. Designed rainfall rate (inches per Hour).
- 2. Piping material: Schedule 40 solid wall PVC or Cast Iron (If PVC, specify sizes you have access to).
- 3. For quicker turnaround time (2-3 days). A fully dimensioned riser drawing with GPM inflow (or individual areas with design rainfall rate).
- 4. For a standard turnaround time (no. of days dependent on complexity and size).
 - A. Plans showing or that can help us determine and fully dimension the following (In AutoCAD .DWG file format only. We can't use .PDF files).
 - i. Catchment areas or the GPM's per drain location (Roof Plans).
 - ii. Preferred piping routes and discharge points (Floor Plans directly below roof.).
 - iii. Elevation from drain to horizontal.
 - iv. Elevation from horizontal to discharge.
- 5. Name, address, contact details including email address of Engineer of record or Design Build Contractor (Please include all contact info in order to set up access to HydroTechnic software).
- 6. Project title.
- 7. Project address (City, State & Zip at minimum).
- Confirmation of below grade being designed to free flow or surcharge (If surcharging, we need to know the height between the center of siphonic horizontal line at discharge to the manhole grate cover).

The provision of all the above requested information allows MIFAB to assist with your siphonic roof drainage design.

We will provide access to our MIFAB[®] HydroTechnic[™] analytical design calculation software for the Engineer of Record, designer and contractor as directed by the EoR. Within HydroTechnic[™] you can access the hydraulic calculation, edit the design, print the design calculation report, BOM and drawing files. All dimensions, GPM's, Routes, Pipe Materials, etc. should be verified by EoR.

Please contact us at hydromax@mifab.com at any time for assistance.

We offer full-time FREE design support. Out experience includes 1,000's of Walmarts!

VIIFAB

R1940-SJ DOWNSPOUT NOZZLE WITH SLIP JOINT INLET

R1940-SJ

The (slip joint inlet downspout nozzle) performs the same function as the R1940 downspout nozzle. The difference between the two is the method of connecting the pipe to the inlet. With the R1940-SJ, the inlet is machined out. This allows cast iron or PVC pipe to extend past the face of the finished wall and rest against the pipe stop. The pipe is secured to the inside of the R1940-SJ via three vandal proof screws.

MIFAB Cleanout Features

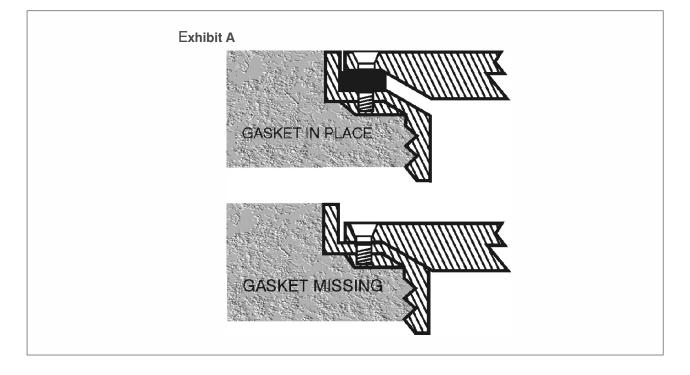

MIFAB Floor cleanouts feature a wide flange cleanout body with an adjustable stainless steel or nickel bronze combined access cover and gasketed plug with O-ring test seal. A floor cleanout is an Emergency Access to a plugged drain line. It makes sense for the cleanout to be designed for immediate access without the need to use special tools and/or clear debris from the plug to gain access. It is also important to ensure the cleanout has been resealed after the cleaning of the drain line to eliminate sewer gas escape. It is preferable that the cleanout design will provide visual assurance that the cleanout has been resealed.

THE CONVENTIONAL SYSTEM

The conventional floor cleanout is usually comprised of an unsealed access cover secured to a housing or frame by up to four (4) screws. Removal of these screws provides access to an opening that more often than not is fouled by construction debris that has entered under the housing, which supports the cover or has entered between the unsealed cover and frame. After removal of the debris, the maintenance person is faced with the removal of a cast iron, brass or plastic threaded plug that has likely seized in place because of dissimilar metals, rust and dirt. The removal of this plug is usually accomplished by breaking (chiselling) it out. Finally, there is an open access, usually less than the four (4) inch opening required by code. After removal of the blockage there is a very good chance that the non-gasketed cover will be replaced because a replacement plug has been almost impossible to source. This does not provide any visual evidence that a plug is not in place and there is the danger of the escape of sewer gas.

THE MIFAB SYSTEM The

MIFAB design of combined gasketed access cover and cleanout plug grants immediate emergency access with the removal of the combined cover/plug by unscrewing three vandal-resistant stainless steel screws. This provides access to a full four (4) inch opening as required by most codes. Replacement of the cover with neoprene gasket glued to the underside provides visual evidence that the cleanout has been properly resealed. If for any reason the gasket has been displaced then the cover will sit low in the frame and it will be obvious that the cleanout has not been properly resealed providing visual evidence of the danger of escaping sewer gas. (See Exhibit A)

CLEANOUTS CLEANOUT FUNCTION AND SELECTION GUIDE

CLEANOUTS

Cleanouts provide access to drainage piping for cleaning out purposes. Since there are a variety of sizes, shapes and materials available, certain considerations must be made when selecting the right cleanout for installation. MIFAB offers many options that may be incorporated together for the perfect solution in all types of construction.

SELECTION OF TOP

The first factor in selecting a top is to decide what shape would be most compatible with the area surrounding it. In most cases a round top is most easily orientated to the floor because it does not conflict with designs, nor does it require alignment to adjacent walls. For floors that are finished of material in a square or straight-line pattern, a square top is available, allowing alignment with tile and adjacent walls. Areas with finished floors, such as offices, hospitals, restaurants and modern manufacturing areas will require finished floor cleanouts. A regularly secured scoriated top is recommended in most cases. Finishes include nickel bronze and stainless steel. The type of traffic that the cleanout top must withstand should be considered. For all loads, the stainless steel top can be used. A scoriated top will service most finished floors. They feature a corrosion-resistant, non-skid finish that will not discolor and will look attractive with almost any surroundings. Vandal-proof screws are available to prevent theft or damage to the inner components of the cleanout. Specify suffix (-6) for Vandal-proof screws. Areas with unfinished floors or areas with possible heavy load traffic such as boiler rooms, warehouses and heavy manufacturing facilities, a ductile iron top should be specified. In areas where the cleanout is concealed, various access covers are available to allow access to the cleanout. A carpet marker should be specified in floors where a minimum showing of metal is desired to indicate the placement of the cleanout. Specify suffix (-RC) for stainless steel carpet marker.

SUGGESTED CLEANOUT SPECIFICATIONS

Cleanouts connected to the drainage system shall be of the same size as pipe up to 4" (25) and not less than 4" (25) on larger sizes (and/or as required by local code*). Cleanouts shall be installed in the building drain as near as practicable to the inner face of the wall through which the drain passes. Where a building trap is inside the building, the cleanout shall be installed at the foot of each vertical sanitary or storm stack; at the end of drainage lines and at all changes of direction of 45 degrees or more. Cleanouts in horizontal drainage lines shall be at the intervals of no more than fifty feet on pipe up to 4" (25) in size and not more than one hundred feet on larger sizes (and/or as required by local code*).

*Check to see if it is necessary to modify above paragraphs to meet local code

*Cleanouts provide an emergency access to the drainage system. Ordinarily they are only opened where there is a blockage in the system when they are likely to release a head of sewage when opened. For this reason, the following general clause should be included. Whenever possible, cleanouts shall be installed so as to provide access from the finished floor. This applies at all floor levels. When cleanouts are located in membrane floors, they shall be supplied with wide anchor flange and clamp devices. Cleanouts in finished areas shall have adjustable round (square) satin stainless steel or nickel bronze tops with scoriated covers to match flooring as specified below.

Suffixes with (-R) have round tops and suffixes with (-S) have square tops. Select applicable catalog number. Polished stainless steel tops that will not oxidize and are heavy duty should be specified by adding suffix (-3)

FINISHED FLOORS (ALL TRAFFIC) C1000-R(S)-3 - non-membrane. C1000-C-R(S)-3 - membrane. Lino tile areas: C1100-T(TS) - non-membrane, C1100-C-T(TS) - membrane. Ceramic and terrazzo areas: C1100-U(US) - non-membrane, C1100-C-U(US) - membrane.

MPB-2019-USA

INTERCEPTORS

REMOVABLE INTERNAL COMPONENTS

MIFAB's single baffle system is removable. Others offer fixed baffles and internal parts that once corroded, compromise the entire interceptor. All of MIFAB's internal parts are removable. This allows for easier maintenance because nothing is fixed and all parts can be removed for maximum access to the inside for cleaning.

POWDER EPOXY COATING

MIFAB's interceptors are manufactured with a powder coated, electrostatically applied cathodic epoxy coating as a standard feature for no additional charge. This ensures maximum wearing and resistance to corrosive cleaning agents.

FEET ON BOTTOM

MIFAB's MI-G and MI-G-L grease interceptors have 1/2" feet on the bottom to elevate the interceptor from the wet ground to prevent corrosion.

SINGLE BOLT

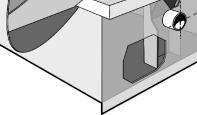

MIFAB's smaller interceptors (up to 25 GPM) have a single 5/8" diameter bolt to secure the lid to the body. Larger interceptors have four large bolts. Others offer screws/wing nuts that become stripped, rusted out, filled with grease/dirt and/or lost. They are also time consuming to remove. MIFAB's lids are easy to remove with the single bolt design, allowing for regular cleaning of the interceptor.

LID

All of MIFAB's interceptors are manufactured with a powder coated, electrostatically applied cathodic epoxy coating as a standard feature. They all have a non-skid tread plate pattern for maximum safety and are recessed into the frame to provide either in ground or above ground installation with the same interceptor.

MIFAB's grease interceptors are manufactured with a "sewer gas stopper" that is sealed on the top and both sides and extends into the static water level to eliminate the possibility of sewer gas entering the grease trap and kitchen area.

(MI-G ILLUSTRATED)

DEEP SEAL TRAP

MIFAB's deep seal trap is covered by the lid. This permits easier roughing-in for the contractor since the interceptor is a perfect rectangle instead of a seven sided shape that requires extra work and time to install. It is also easier to clean out the deep seal trap with a MIFAB interceptor because one only needs to remove the lid and access is available to the body and the deep seal trap at the same time.

Visit www.mifab.com for the most recent product information.

Structural Integrity 2.

1. External Vented Flow Control Fitting

Ribbed body design provides extra structural integrity for in ground installations. The body is manufactured in the USA out of a seamless, injection molded high density polyethylene (H.D.P.E.) with a 3/8" uniform wall thickness. The body is strong but lightweight, allowing it to be installed without the need of a backhoe or crane.

All of MIFAB®'s PDI approved grease interceptors are supplied with an external, vented flow control fitting.

FEATURES AND

BENEFITS

3. Approvals

All eight of the Lil Max[®] plastic grease interceptors are tested and certified to the PDI G-101, ASME A112.14.3 and CSA B481 Standards and listed with IAPMO. Lil Max grease interceptors are in compliance with International Plumbing Code (I.P.C.) / I.C.C. by I.A.P.M.O.

4. **Options and Accessories**

MIFAB®'s 35 years of experience with grease interceptors provides us

TIFAB[®] Lil Max

with a superior knowledge of options and accessories often required with grease interceptors. We can expertly provide any of the following options: dosing pump, enzyme port, high level alarm, multiple inlet and outlet ports, sediment bucket and threaded connections.

5. Made in the USA

MIFAB®'s plastic grease and oil interceptors are made in the United States of America and meet the requirements of the Buy American Act.

6. Lifetime Warranty

MIFAB[®] offers a limited lifetime warranty on all of our plastic grease and oil interceptors.

7. Lightweight

MIFAB[®]'s Lil Max[®] plastic grease interceptors are injection molded with Polypropylene material. They weigh significantly less than steel grease interceptors and therefore are much easier to handle and install.

Individually Boxed Interceptors 8.

Every Lil Max[®] plastic grease interceptor is shipped to you in its own cardboard box for easy handling and protection of the product during shipping and handling. All Lil Max interceptors can be shipped via UPS / Fedex.

9 Sealed Lid

The lid sealing gasket is located within the underside of the lid – not in the top of the interceptor. This prevents tearing and wear on the gasket and provides a more secure seal to minimize odors.

10. Easy to Remove Lid

The latches securing the lid to the body are easy to open and are made with an extra wide finger access area. No tools are required to open the lid of the Lil Max[®] interceptors.

11. Easy to Clean

The internal baffle can be easily removed and the lid covers the entire open area of the inside of the interceptor for complete and unrestricted access to the interior of the interceptor for cleaning.

12. Modularity

The Lil Max[®] interceptors can be converted at the MIFAB[®] factory into oil interceptors with the oil draw off and vent connections for applications that require oil interceptors. Lil Max can also be converted into solids, plaster, lint, rice and fish scale interceptors.

* Complete Range of Sizes

The Lil Max[®] grease interceptors are available in 7, 10, 15, 20, 25, 35 and 50 GPM sizes in addition to a 25 GPM low profile model. The 10 through 50 GPM models are also available as oil, solids, plaster, lint, sand, fish scale and rice interceptors.

Made in U.S.A.

MIFAB[®] LARGE H.D.P.E. GREASE INTERCEPTORS

MPB-2019-USA

Since 1982, MIFAB[®] has been manufacturing grease interceptors. Thirty-five years of experience and customer feedback has given us an advantage when it comes to designing and manufacturing the best steel and stainless steel grease interceptors in the market. We have applied this experience to our new range of large, H.D.P.E. patented grease interceptors. We invite you to experience the MIFAB[®] difference – best in class when it comes to H.D.P.E. grease interceptors. The Big Max[®] Series of interceptors are also available in the following models: oil, solids, plaster, lint, sand, fish scale and rice.

rises to the surface for manual or pump out removal and the baffle is easy to remove for cleaning. The waste water is now relieved of over 90% of the fats, oils, and greases and continues to flow through the interceptor.

External Sampling Port

For jurisdictions that require the installation of an external sampling port, the MIFAB® XL-MI-G-PL-SP is the answer. It is manufactured from HDPE and available with a standard AASHTO H-20 load rated cover. (Specify suffix -SP)

Note that the the alarm control box and float switch are not installed at the MIFAB factory. They need to be installed on site.

 192

1. External Vented Flow Control Fitting

FAB

All of MIFAB[®]'s PDI approved grease interceptors are supplied with an external, vented flow control fitting. Studies have proven that the use of an external, vented flow control fitting results in more effective grease interception because of the air introduced into the drain line through the vent in the top of the flow control fitting. As this air enters the interceptor, grease coats the resulting air bubbles and increases the efficiency of the grease rising to the surface.

BIG

2. Sample Port Access

Sample port access is provided standard in our interceptors. Simply remove the lid to gain access to the top opening of the internal inlet and outlet piping. A sample of the water discharging from the interceptor can be taken from the top opening of the outlet piping (deep seal trap).

3. H-20 Load Rated Lid

Standard, 20,000 Lb. AASHTO H-20 load rated steel encased composite, gasketed lids and collar are standard to withstand heavy loads

4. Structural Integrity

Ribbed body design provides extra structural integrity for in ground installations. The body is manufactured in the USA out of seamless, rotationally molded High Density Polyethylene with a 3/8" uniform wall thickness. The body is strong but lightweight, allowing it to be installed without the need of a backhoe or crane. The H.D.P.E. material will not crack, chip or bulge under extreme impact, sunlight and / or temperature changes. H.D.P.E. is a much better material for interceptors than fiberglass because H.D.P.E. has resistance to a greater number of chemicals than fiberglass. Fiberglass is also hard and stiff and is subject to cracking. A rotationally molded H.D.P.E. interceptor is simply tougher and has much greater impact resistance vs. fiberglass. Fiberglass interceptors also have a negative environmental impact because they are made with VOCs - (Volatile Organic Compounds). Facilities that produce fiberglass interceptors have a negative impact on the environment because of VOCs they put into the air. Rotationally molded H.D.P.E. interceptors have NO environmental impact.

5. Narrow Width

The 33 ½" width allows the interceptor to fit through doorways and down stairwells. Two people can carry and install the interceptor.

6. With MIFAB's patented extension system every lid ships with an 18" x 18" piece of ADS corrugated pipe which provides the installer with up to a 24 1/2" "C" dimension.

If a greater "C" dimension is required, the contractor has the option to purchase an extension from MIFAB[®] or to buy a length of ADS pipe from their local waterworks wholesaler in order to complete the installation immediately. This also means that the cost of the MIFAB[®] extension (when ordered from a local waterworks wholesaler will be significantly less expensive that buying the same height extension system from others). In addition, extensions from others are only available from that specific manufacturer – resulting in

delays and time for production and shipment to the contractor. Flexible extensions make for easier installation where grade may be unlevel.

7. Extra Rough-in Dimension

The standard rough-in dimension ("C" dimension – from the middle of the inlet / outlet to the top of the lid) is $24\frac{1}{2}$ " and can be field adjusted by the contractor down to $15\frac{1}{2}$ " on the XL-MI-G-PL-750 and to 16" on the XL-MI-G-PL-1150. The $24\frac{1}{2}$ " rough-in dimension provided is almost double that of others – making it less likely to buy expensive extensions.

8. Forklift Access

Forklift access points are provided in the bottom of the interceptors to allow for easy handling.

Approvals

MIFAB®'s XL-MI-G-PL-750 and XL-MI-G-PL-1150 grease interceptors are tested and certified to the PDI G-101, ASME A112.14.3 and CSA B481 Standards and listed with IAPMO. Lil Max grease interceptors are in compliance with International Plumbing Code (I.P.C.) / I.C.C. by I.A.P.M.O.

Grease Design Capacity

MIFAB[®]'s XL-MI-G-PL-750 has a flow rate of 75 GPM and a grease design capacity of 750 lbs. and the XL-MI-G-PL-1150 grease interceptor has a flow rate of 100 GPM and a grease design capacity of 1,150 lbs. These capacities are greater than others in the market.

Grip Points for Anchor Kit

Two grip points are provided on each side of the interceptor for easy handling. These grip points also serve as securing areas for MIFAB[®]'s high water anchor kit which allows the contractor to secure the interceptor to the ground before concrete is poured around the unit (Suffix –AK).

Options and Accessories

MIFAB[®]'s 35 years of experience with grease interceptors provides us with a superior knowledge of options and accessories often required with grease interceptors. We can expertly provide any of the following options: dosing pump, enzyme port, high level alarm, multiple inlet and outlet ports, sediment bucket and threaded connections.

Lifetime Warranty. Made in the USA

MIFAB® offers a limited lifetime warranty on all of our plastic grease and oil interceptors. MIFAB®'s plastic grease and oil interceptors are made in the United States of America and meet the requirements of the Buy American Act.

Multiple Inlet/Outlet Options

MIFAB[®]'s interceptors are manufactured with two flat spaces on each side for two optional side inlets or outlets on both sides of the interceptor. This allows for straight through or side inlet/outlet pipe connections. (Specify required suffix for desired optional inlet/outlet).

193

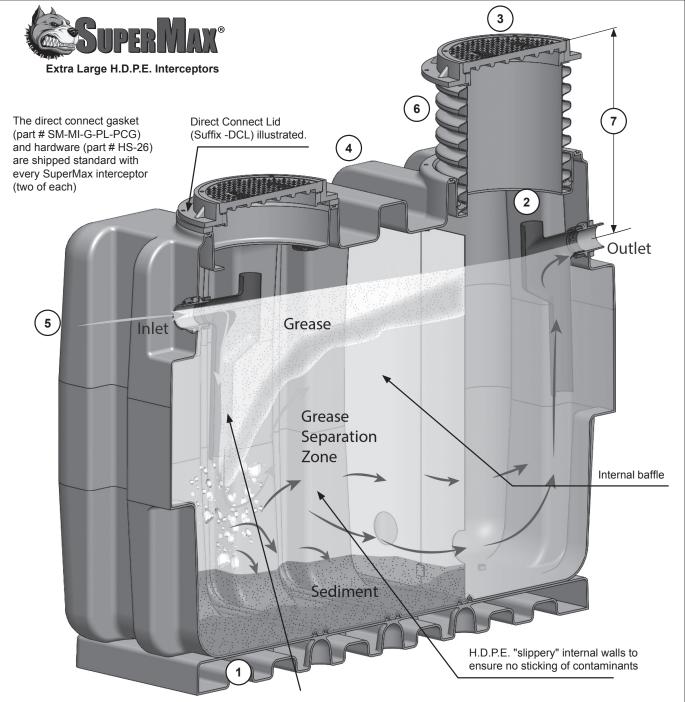

MPB-2019-USA

EXTRA LARGE H.D.P.E. GREASE AND OIL INTERCEPTORS

MPB-2019-USA

Since 1982, MIFAB® has been manufacturing grease interceptors. Thirty-five years of experience and customer feedback has given us an advantage when it comes to designing and manufacturing the best steel and stainless steel grease interceptors in the market. We have applied this experience to our new range of large, H.D.P.E., patented grease interceptors. We invite you to experience the MIFAB® difference – best in class when it comes to H.D.P.E. grease interceptors. The SUPERMAX® Series of interceptors are also available as oil interceptors.

MIFAB®'s 35 years of manufacturing interceptors has provided us with a wealth of experience and knowledge on the factors that impact their performance. Our new and innovative Enviro-Flow® inlet and outlet design significantly reduces inlet velocity and creates optimal laminar flow to ensure maximum grease separation efficiency. Flow entering the MIFAB® interceptor is directed to the bottom by the inlet baffle to avoid any disturbance of the previously accumulated surface layer of grease / oil in the interceptor. The innovative design of the bottom of the inlet baffle directs the incoming waste water sideways into the interceptor for the most efficient laminar flow. The baffle also serves to reduce the velocity and surge of inflow, providing sufficient retention time for effective separation of the grease. The grease rises to the surface for manual or pump out removal and the baffle is easy to remove for cleaning. The waste water is now relieved of over 90% of the fats, oils, and greases and continues to flow through the interceptor.

Design and dimensions are subject to modification. Prices do not include applicable taxes. Visit www.mifab.com for the most recent product information. 194

MIFAB®, Inc., 1321 West 119th Street, Chicago, Illinois 60643-5109, USA All sales subject to MIFAB's® Terms and Warranties. Please refer to inside front cover. sales@mifab.com • Canada Toll Free: 1-800-387-3880

FEATURES AND IFAB SUPERMAX BENEFITS **MPB-2019-USA**

A base is always included with the SUPERMAX[®] interceptors. This is an expensive option from others. The base provides a flat surface so that the interceptor can easily be installed above ground in applications like parking lot spaces. The base is 6" high and is always secured to the underside of the interceptor.

2. Sample Port Access

Sample port access is provided standard in our interceptors. Simply remove the lid to gain access to the top opening of the internal inlet and outlet piping. A sample of the water discharging from the interceptor can be taken from the top opening of the outlet piping (deep seal trap).

H-20 Load Rated Lid 3.

Standard, 20,000 Lb. AASHTO H-20 load rated steel encased composite, gasketed lids and collar are standard to withstand heavy loads

4. Structural Integrity

Ribbed body design provides extra structural integrity for in ground installations. The body is manufactured in the USA out of seamless, rotationally molded High Density Polyethylene with a 3/8" uniform wall thickness. The body is strong but lightweight, allowing it to be installed without the need of a backhoe or crane.

H.D.P.E. Material 5.

MIFAB®'s SUPERMAX® grease and oil interceptors are made with 3/8" thick rotationally molded H.D.P.E. material. H.D.P.E. is less brittle than fiberglass and less likely to crack during installation. The ribbed body design provides for extra rigidity and is less likely to crack or break when installed underground and subject to earth pressures. H.D.P.E. has resistance to a greater amount of chemicals vs. fiberglass. Fiberglass is also hard and stiff and is subject to cracking. A rotationally molded H.D.P.E. interceptor, is simply tougher and has much greater impact resistance vs. fiberglass.

Fibreglass interceptors have a negative environmental impact because they are made with VOC's - (Volatile Organic Compounds). Facilities that produce fiberglass interceptors have a negative impact on the environment because of VOCs they put into the air. Rotationally molded H.D.P.E. interceptors have NO environmental impact.

Extensions 6

With MIFAB®'s patented extension system every lid ships with an 24" x 24" piece of ADS corrugated pipe which Kev provides the installer with up to a 37.25" "C" dimension. If a greater "C" dimension is required, the contractor has the option to purchase an extension from MIFAB® or to buy a length of ADS pipe from their local waterworks wholesaler in order to complete the installation immediately. This also means that the cost of the MIFAB® extension (when ordered from a local waterworks wholesaler will be significantly less expensive that buying the same height extension system from others). In addition, extensions from others are only available from that specific manufacturer - resulting in delays and time for production and shipment to the contractor. Flexible extensions make for easier installation where grade may be unlevel.

7. **Extra Rough-in Dimension**

The standard "C" dimension on SUPERMAX[®] models is 37.25" and can be field adjusted by the contractor down to 20.25". The standard "C" dimension from others is typically 18". This means that contractors will not have to buy extensions as often - resulting in savings.

Approvals

MIFAB®'s SUPERMAX® grease interceptors are tested and certified to the ANSI Z1001-2016, ASME A112.14.3, CSA B481 Standards and listed with IAPMO. The SM-MI-G-PL-500 is also tested and certified to the P.D.I. G-101 Standard.

Options and Accessories

MIFAB®'s 35 years of experience with grease interceptors provides us with a superior knowledge of options and accessories often required with grease interceptors. We can expertly provide any of the following options: dosing pump, enzyme port, high level alarm, multiple inlet and outlet ports, sediment bucket, coalescing pack and, threaded connections.

Lifetime Warranty. Made in the USA

MIFAB® offers a limited lifetime warranty on all of our plastic grease and oil interceptors. MIFAB®'s plastic grease and oil interceptors are made in the United States of America and meet the requirements of the Buy American Act.

Multiple Inlet/Outlet Options

MIFAB®'s interceptors are manufactured with flat spaces on each side for two optional side inlets or outlets on both sides of the interceptor. This allows for straight through or side inlet/outlet pipe connections. (Specify required suffix for desired optional inlet/ outlet.)

U.S.A

INTRODUCTION

Grease Interceptors

Grease, which also includes fats and oils, has historically caused problems in plumbing drainage systems. Grease easily adheres to the inner surface of most commonly used drainage piping material and over time will form into a hard crust as tough as baked clay. The rougher the inner surface of the pipe, the easier this adherence will occur. Grease is also a problem for sewage treatment plants as it taxes the bacterial process used to break down these complex compounds. The purpose of a grease interceptor is to trap and store the suspended grease from the water passing through it. They are usually connected to kitchen sinks, floor drains, and any other plumbing fixtures in restaurants, hotels and institutions that discharge grease laden waste water. MIFAB's grease interceptors operate on the principle of separation by flotation. As our environmental laws have become more restrictive and maintenance costs have increased, public sewer departments have responded by tightening the list of materials allowed to flow into their systems. Severe fines may be levied on those users found to be in violation. Grease that is removed from the drainage system as close as possible to its source and before it becomes contaminated with other material, can be sold to rendering companies and recycled into a variety of products. It can therefore become an economic asset rather than liability.

Sizing

Reliable performance of any grease interceptor is dependent on its being correctly sized to handle the anticipated drainage load from the fixtures it serves. Each MIFAB interceptor is flow and capacity rated for easy selection when sizing requirements have been established and met. Sizing is based on fixture drainage period, service required and volume of wastewater to be handled. These factors combine to establish the anticipated flow rate and the size of the interceptor required. The flow control fitting that is provided with every MIFAB grease interceptor sized 50 GPM and smaller, is installed in the fixture drain line ahead of the interceptor and controls the flow of drainage to the interceptor's rated capacity. This is especially important when the drainage load exceeds that for which the interceptor is sized to handle. The following sizing formula is based on the P.D.I. G-101 (Plumbing and Drainage Institute) requirements: Calculate the volume in cubic inches of all the fixtures to be served by the Grease Interceptor. (length x width x depth = capacity) 1.

2. * Eg: 15" x 10" x 24" = 3600 cubic inches. Since a three compartment sink is serving the grease interceptor, multiply the single compartment cubic inch capacity by three to obtain the total capacity in cubic inches. (10,800 in³). Divide this number by 231 to convert the volume to US gallons. * Eg: Cubic capacity of 10,800 in³÷231=46.75 gallons; multiplied by 75% = 35.06 U.S.G. Use MIFAB® model number MI-G-6 which has a rated flow capacity of 35 G.P.M.

These capacities are based on a one minute drain-down time with the interceptor adjacent to the fixture(s). If a two minute 3. drain-down time is acceptable, then divide the capacity by two.

The flow control fitting, supplied with the interceptor, must be in position at all times. If this is removed, or not provided, the interceptor will not function to P.D.I. standards.

5. If an interceptor is to be installed with the top level at the finished floor, an extension type may be required. In that instance, the "C" dimension is required, (center line of inlet/outlet to top of the finished floor) and must be specified at time of ordering.

Fixture Unit Sizing Method

The majority of plumbing codes list the drainage fixture-unit values for plumbing fixtures. For fixtures not listed, the codes provide drainage fixture-unit values based on drain outlet or trap size. Drainage fixture-unit values are converted to GPM discharge rates on the basis of one drainage fixture-unit equaling 7.5 GPM fixture discharge rate. The drainage fixture-unit sizing for grease interceptors is included for those that prefer this approach as an alternative to the conventional (volume) sizing. The following table provides the suggested PDI size grease interceptor based on drainage fixture-unit sizing method.

Fixture Outlet or Size (inches)	Drainage Trap Fixture-unit Value	GPM Discharge Equivalent	Suggested GPM Flow Rate Interceptor	MIFAB Model Number
1-1/4"	1	7.5	10	MI-G-2
1-1/2"	2	15.0	15	MI-G-3
2"	3	22.0	25	MI-G-5
2-1/2"	4	30.0	35	MI-G-6
3"	5	37.5	50	MI-G-7
4"	6	45.0	50	MI-G-7

The following factors may require an increase in the size of the grease interceptor: location, presence of detergents in the waste water, ratio of grease to water, specific gravity weight of the grease filtrates, speed of incoming water flow, presence of large particles mixed with the grease laden water, and percentage of maximum flow capacity. The interceptor should be installed as close as possible to the source of grease to prevent pipes draining into the grease interceptor from becoming clogged as grease-laden water cools before entering the grease interceptor.

MAINTENANCE & GENERAL CONSIDERATIONS

To obtain optimum operating efficiency of a properly sized and installed PDI certified grease interceptor, a regular schedule of maintenance must be adhered to. All PDI certified grease interceptors are furnished with manufacturer's operating and maintenance instructions, which must be followed to insure efficient satisfactory operation.

CLEANING

196

All grease interceptors must be cleaned regularly. The frequency of grease removal is dependent upon the capacity of the interceptor and the quantity of grease in the waste water. Grease removal intervals may therefore vary from once a week to once in several weeks. When the grease removal interval has been determined for a specific installation, regular cleaning at that interval is necessary to maintain the rated efficiency of the interceptor. After the accumulated grease and waste material has been removed, the interceptor should be thoroughly checked to make certain that inlet, outlet and air relief ports are clear of obstructions.

DISPOSITION OF INTERCEPTED MATERIALS

Grease and other waste matter that has been removed from the interceptor should not be introduced into any drain, sewer, or natural body of water. This waste matter should be placed in proper containers for disposal. Where recovery of grease is desired, it can be handled in a manner suitable to the authorities.

Design and dimensions are subject to modification. Prices do not include applicable taxes. Visit www.mifab.com for the most recent product information.

MIFAB INTERCEPTOR SELECTION GUIDE

There are three main types of interceptors: grease, oil and solids. Each of them requires different considerations for sizing, operation and maintenance. The information provided will help the specifier select the correct interceptor for the application. A detailed explanation of the major components and features of each type of interceptor is also provided.

Grease Interceptors

Grease, which also includes fats and oils, has historically caused problems in plumbing drainage systems. Grease easily adheres to the inner surface of most commonly used drainage piping material and over time will form into a hard crust as tough as baked clay. The rougher the inner surface of the pipe, the easier this adherence will occur. Grease is also a problem for sewage treatment plants as it taxes the bacterial process used to break down these complex compounds.

The purpose of a grease interceptor is to trap and store the suspended grease from the water passing through it. They are usually connected to kitchen sinks, floor drains, and any other plumbing fixtures in restaurants, hotels and institutions that discharge grease laden waste water. MIFAB's grease interceptors operate on the principle of separation by flotation.

As our environmental laws have become more restrictive and maintenance costs have increased, public sewer departments have responded by tightening the list of materials allowed to flow into their systems. Severe fines may be levied on those users found to be in violation. Grease that is removed from the drainage system as close as possible to its source and before it becomes contaminated with other material, can be sold to rendering companies and recycled into a variety of products. It can therefore become an economic asset rather than liability.

The specifying engineer should consider the following when specifying grease interceptors: construction / operation, flow control fitting, extensions, cover shrouds and draw-off valves, sizing, installation and maintenance.

Construction / Operation

All of MIFAB's grease, oil and solids interceptors are manufactured with 10 gauge hot rolled steel that is welded together and coated with an electro-statically applied baked epoxy finish. The cover sealing gasket is manufactured with low durometer closed-cell neoprene with self-adhesive backing. The gasket is custom fitted to the interceptor body top rim ledge where it is an integral part of the body. Because of the gasket's thickness and density, it provides an ideal sealing environment for the lid. All of MIFAB's interceptors are supplied with the same gasket. All grease interceptors are supplied with a baffle system engineered to improve the grease/oil separation process. The baffle system is strategically located to direct inflow for maximum efficiency of the interceptor. Flow entering the interceptor is directed to the bottom by the baffle to avoid any disturbance of the previously accumulated surface layer of grease / oil in the device. The baffle also serves to reduce the velocity and surge of inflow, providing sufficient retention time for effective separation of the grease. The grease rises to the surface for manual or draw-off removal and the baffle is easy to remove for cleaning. The waste water is now relieved of over 90% of the fats, oils and greases and continues to flow through the interceptor into the drainage system. Many MIFAB grease interceptors bear the PDI (Plumbing and Drainage Institute) seal. This seal on MIFAB's grease interceptors proves that the designs and ratings marked on the interceptor have met or surpassed all standards established by PDI. All of MIFAB's PDI approved grease interceptors are supplied with external, vented flow control fittings to ensure maximum performance. A detailed description of flow control fittings is on page 198.

MIFAB FLOW CONTROL FITTING GUIDE

FLOW CONTROL FITTING APPLICATION: Flow control fittings are furnished at no extra cost with all MIFAB® MI-G, MI-G-L MI-G-SD MI-G-SDH and MI-G-L-SDH grease interceptors. They are essential to achieve maximum efficiency.

FLOW CONTROL FITTING DESCRIPTION: Flow control fittings insure 90% or more grease retention efficiency of the interceptor. When consideration isn't given to the flow rate of the waste water to be handled, the actual flow rate through the interceptor usually exceeds its rated maximum. With such flow rate, the interceptor would be overloaded. Retention time within the unit would not be sufficient for maximum separation. The result would be low efficiency, and pollutants left in the waste water would pass through the interceptor, making the installation less than effective. When the flow is controlled by use of a MIFAB® flow control fitting so that it can never exceed the maximum rating of the interceptor, and the interceptor is cleaned on a regular basis, the maximum pollutant retention efficiency will be achieved and maintained.

All flow control fittings are built with an air intake and should be connected to the vent stack or vent not lower than the flow level of the highest drain serviced or terminated in a return bend at the same elevation outside of the building. A vented flow control fitting improves the efficiency of the grease interceptor by introducing air into the body of the interceptor. As the air bubbles rise to the surface, they are coated with grease. This process brings grease to the surface faster, and, as a result, increases the efficiency.

MIFAB INTERCEPTOR SELECTION GUIDE (Cont'd)

Extensions

Extensions should be specified on grease and oil interceptors when the interceptor is buried into the ground, vertical adjustment of the interceptor is necessary to meet the drainage piping, and/or floor level access is required. Extension heights range from four inches to any maximum practical for serviceability. Extensions in excess of 20" are not recommended. One must consider the slope of the drainage piping from the fixtures to the inlet of the interceptor. Typically, one should allow a slope of 1/8" per foot in the drainage pipe. Therefore, there will be many installations, especially with large interceptors, where the sloped drainage pipe ends up below the inlet connection. An extension is added to the top of the interceptor so that the inlet can be lowered to meet the incoming drainage pipe and the lid of the interceptor can be extended to floor level. MIFAB offers three different kinds of extensions: integral, bolt on and cover shrouds. An integral extension is specified by expanding the "C" dimension on the interceptor. The "C" dimension is from the middle of the inlet and outlet to the top of the interceptor. One would specify a "C" dimension to meet the job requirements and the interceptor will be manufactured to that specification. The extension is incorporated into the production of the interceptor to produce a seamless, integral interceptor. A second method of providing an extension is a bolt on design. In this example, a top is manufactured out of the same material as the body. The extension is secured to the body by means of "C lock" devices bearing against its base flange, compressing the sealing gasket to complete the union. The regular lid is bolted to the extension top in the same manner as it would be to the body of a standard interceptor.

Cover Shrouds

In installations where the exact extension dimension required is unknown or where little notice has been provided to the installer advising of the need for an extension; integral and bolt on extensions are impractical due to the time necessary for their fabrication. MIFAB's nationwide network of manufacturer's representatives stock cover shrouds for immediate shipment to jobsites when these situations occur. The cover shroud is adjustable and is recessed into the slab to house the interceptor. Cover shrouds incorporate either standard or draw-off grease interceptors mounted on adjustable elevation cradles in either open or closed bottom housings with non-skid floor level lids. Cover shrouds are particularly important where below floor level installation of draw-off grease interceptors is required, because such models cannot be installed independently with tops at the finished floor level. Specify MIFAB MI-CS Series for use with the MI-G Series grease interceptors and MIFAB MI-CSD Series for use with the MI-G-SD and MI-G-SDH semi-automatic draw off grease interceptors.

(MI-CS COVER SHROUD ILLUSTRATED)

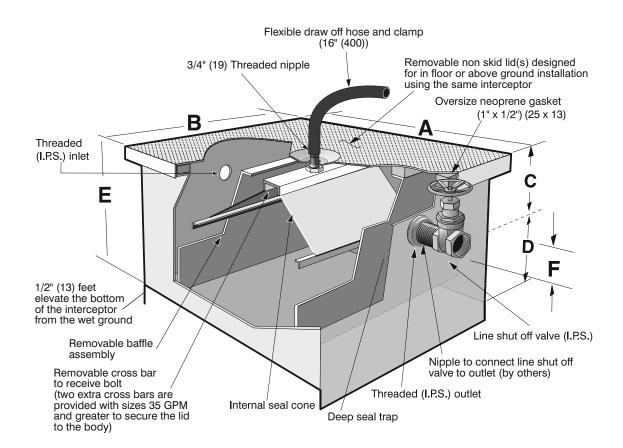

199

MIFAB

MIFAB INTERCEPTOR SELECTION GUIDE (Cont'd)

Draw-off valve

All of MIFAB's semi-automatic grease interceptors are manufactured with draw-off valves and are preferred in areas where excessive amounts of grease accumulates because they make the cleaning process easier. The draw-off valve is a gate valve that is connected to the outlet of the interceptor via a pipe nipple. When the accumulated grease is ready to be drawn off, the pipe cap on the top of the interceptor is removed and the draw-off hose is attached with a hose clamp. After warming the interceptor with hot water from the fixture to liquefy the accumulated grease, the draw-off valve is closed to block water escaping through the outlet. Water from the fixture enters at a low flow rate to elevate the liquefied grease into the draw-off pyramid and through the hose to the disposal container. When clear water appears at the hose outlet, the draw-off valve is opened to drop the water level in the interceptor for normal operation. This method of cleaning is more sanitary that the typical manual method. Specify MIFAB Series MI-G-SD, MI-G-SDH and MI-G-L-SDH Series of semi-automatic grease interceptors.

VIIFAB

MPB-2019-USA

SERIES

HLA SERIES HIGH LEVEL ALARM

The purpose of the High Level Alarm is to monitor and send an audible and visual alarm when the interceptor's grease or oil capacity is approximately 75% full.

High level alarm systems can be installed on any MIFAB grease or oil interceptors to allow the customer to monitor grease and oil levels. This allows the interceptor to be maintained when required.

The -HLA option includes an alarm control box that is weatherproof rated NEMA 4/4X, 6' 120VAC power cord, 360° viewable alarm light, 85db @ 10' solid tone alarm, and a silence and test button that is to be mounted to the nearest structure. It also includes a float switch that is mounted inside the interceptor for oil or grease level detection and is connected to the alarm control box.

List Price for -HLA is \$11,766.00

Note: The -HLA is not factory installed by MIFAB. It is shipped loose with the interceptor and is to be connected to the grease / oil interceptor on site.

OPTION LEAK DETECTION (\mathbf{L},\mathbf{D})

The purpose of the Leak Detection system is to monitor any leaks that may occur through the first wall of a double wall interceptor.

The Leak Detection system can only be used in a double wall construction. It is typically used in high risk applications where the seal of the interceptor needs to be monitored.

The Leak Detection option includes an alarm control box that is weatherproof rated NEMA 4/4X, 6' 120VAC power cord, 360° viewable alarm light, 85db @ 10' solid tone alarm, and a silence and test button that is to be mounted to the nearest structure. It also includes a pressure switch that is made from 316 stainless steel and is mounted inside the interceptor for oil or grease level detection and is connected to the alarm control box.

List Price for -LD is \$11,766.00

Note: The -LD is not factory installed by MIFAB. It is shipped loose with the interceptor and is to be connected to the grease / oil interceptor on site.

DS OPTION **ENZYME DOSING PUMP**

The purpose of the Enzyme Dosing pump is to release grease and bacteria eating enzymes into the grease interceptor to consume the accumulated grease.

The Enzyme Dosing pump can be ordered with any MIFAB grease interceptor. It is ideal for grease interceptors that are located in high volume kitchens.

The Enzyme Dosing pump includes a 120V fully automatic dosing pump with a programmable 24 hour timer and dosage run time. The system also includes 15' of Poly tubing.

List Price for ENZYME DOSING pump is \$4,202.00

Visit www.mifab.com for the most recent product information.

Design and dimensions are subject to modification. Prices do not include applicable taxes.

MIFAB GREASE INTERCEPTOR INSTALLATION AND MAINTENANCE GUIDE

Installation Diagrams

Figures A2.5.1 through A2.5.5 are included to illustrate various grease interceptor installations normally encountered in domestic, commercial and institutional systems. These figures will serve as a guide to practical application of grease interceptors.

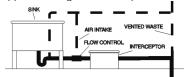

Fig. A2.5.1 Interceptor Serving Trapped and Vented Sink - Flow Control Air Intake Intersects Vent

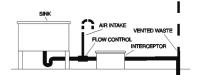

Fig. A2.5.2 Interceptor Serving Sink - Flow \overline{C} ontrol Air Intake Terminates in a Return Bend Above Flood Level

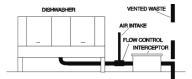

Fig. A2.5.3 Interceptor Serving Dishwasher - Flow Control Air Intake Terminates Above Flood Level

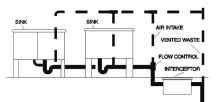

Fig. A2.5.4 Interceptor Serving Two Individually Trapped and Vented Sinks - Flow Control Air Intake Intersects Vent

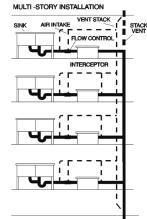

Fig. A2.5.5 Interceptor Serving Trapped and Vented Sinks - Flow Control Air Intakes Intersect V ent

INSTALLATION CONSIDERATIONS

Install interceptor as close as practical to fixture or fixtures being served, see figures A2.5.1 through A2.5.5. The interceptor may be set on the floor, partially recessed in the floor, with top flush with the floor, or fully recessed below the floor to suit piping and structural conditions. Anticipate sufficient clearance for removal of interceptor cover for cleaning. Avoid installation wherein long runs of pipe (exceeding 25 feet (7500)) are necessary to reach interceptor. This precaution will preclude the possibility of pipeline becoming clogged with congealed grease that will collect before reaching the grease interceptor. Do not install grease interceptor in waste line from garbage grinder. Garbage grinder waste must by-pass interceptor, for rapid accumulation of solid matter will greatly reduce grease interceptor efficiency preventing operation in compliance with rated capacity.

FLOW CONTROL

The flow control fitting furnished with PDI certified interceptors must be installed ahead of interceptor in the waste line beyond the last connection from the fixture and as close as possible to the underside of lowest fixture. When waste of two or more sinks or fixtures are combined to be served by one interceptor, a single flow control fitting should be used. Air intake for flow control may terminate under sink drain board as high as possible to prevent overflow or terminate in a return bend at the same height and on outside of building. When fixture is individually trapped and back-vented, air intake may intersect vent stack. All installation recommendations subject to approval of code authority.

VENTING

Grease interceptors must have a vented waste, sized in accordance with code requirements for venting traps to retain water seal and prevent siphoning.

MULTIPLE FIXTURE INSTALLATION

One interceptor to serve multiple fixtures is recommended only where fixtures are located close together. In such installations, each fixture should be individually trapped and back-vented.

MAINTENANCE GENERAL CONSIDERATIONS

To obtain optimum operating efficiency of a properly sized and installed PDI certified grease interceptor, a regular schedule of maintenance must be adhered to. All PDI certified grease interceptors are furnished with manufacturer's operating and maintenance instructions, which must be followed to insure efficient satisfactory operation.

CLEANING

All grease interceptors must be cleaned regularly. The frequency of grease removal is dependent upon the capacity of the interceptor and the quantity of grease in the waste water. Grease removal intervals may therefore vary from once a week to once in several weeks. When the grease removal interval has been determined for a specific installation, regular cleaning at that interval is necessary to maintain the rated efficiency of the interceptor. After the accumulated grease and waste material has been removed, the interceptor should be thoroughly checked to make certain that inlet, outlet and air relief ports are clear of obstructions.

DISPOSITION OF INTERCEPTED MATERIALS

Grease and other waste matter that has been removed from the interceptor should not be introduced into any drain, sewer, or natural body of water. This waste matter should be placed in proper containers for disposal. Where recovery of grease is desired, it can be handled in a manner suitable to the authorities.

MIFAB INTERCEPTOR SELECTION GUIDE (Cont'd)

Dishwashers

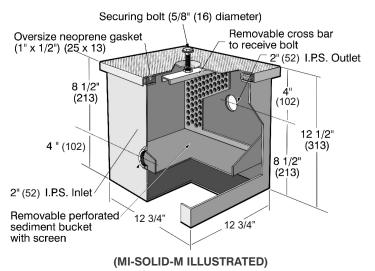

A separate grease interceptor is recommended for each commercial dishwasher. The size of the interceptor is determined by the GPM discharge rate of the dishwasher as specified by the manufacturer.

Floor Drains

Many local plumbing inspectors require that grease laden wastewater flowing into floor drains must flow through a grease interceptor before draining into the sanitary sewer system. In these instances, the flow control fitting must be installed underground, before the inlet to the interceptor, to moderate the flow from the floor drains and to ensure maximum performance. Consideration should be given to providing access to the flow control fitting in these installations for proper cleaning and maintenance. The MIFAB MI-CSD extended cover shroud is best used in these situations because it is long enough to house the grease interceptor and the flow control fitting beside the inlet. A hole can be cut into the lid of the cover shroud to allow the vent piping to connect to the top of the flow control fitting.

Solids interceptors

The interception and retention of solids cannot be overlooked. Materials such as lint, hair , grindings, ceramic waste, plaster, dental wastes, aquarium and other small gravel, jewels and precious metals are a few solids that should pass through a solids interceptor before entering the waste drain line. Deleterious solids should be intercepted to prevent clogging of the drainage lines and valuable materials require interception for retrieval. MIFAB manufactures a complete line of solids interceptors designed to handle any waterborne solids. Most often these interceptors replace the standard traps of the fixtures they serve. The solids interceptor with a low inlet and high outlet becomes the fixture trap. Solids interceptors are manufactured with easily removable strainers or sediment baskets that serve to retain the intercepted solids while allowing water to flow through. It is good engineering practice to specify a solids interceptor before they enter the grease interceptor. This will ensure that the grease interceptor is not filled as quickly with solid wastes that will only impair its efficiency. In addition, most foul odors from grease interceptors are from rotting solids, not from the grease interceptors filled with rotting solids. See MIFAB's MI-SOLID, MI-LINT, MI-HAIR and MI-FISH Series of solids interceptors.

MIFAB OIL INTERCEPTOR SELECTION GUIDE

APPLICATION:

MIFAB® oil interceptors are designed for use in drain lines where oils, sediment and other volatile liquids are found. These drain lines may be from areas in parking garages, machine shops, service stations, aircraft hangars, industrial and manufacturing facilities.

DESIGN:

MIFAB® oil interceptors are designed to protect against water pollution by preventing oils and sediment in waste water from entering drain lines. The design allows intercepted oils to be drawn-off automatically for storage continuously during operation. Sediment should be removed from the interceptor at regular intervals.

SIZING:

INTERCEPTORS

- 1. Determine maximum volume of waste water in G.P.M. or L.P.M., by summing volumes of all discharging fixtures that may enter the drain lines at one time.
- 2. Select oil interceptor with flow rating equal to peak volume in G.P.M. or L.P.M. (see table on shop drawing.) Provide storage tank capable of handling the volume.

TYPICAL CODE REGULATIONS

Vehicle servicing. When an oil interceptor is installed in an automobile, truck, bus, or tractor garage or in a service station or repair shop with facilities for motor or transmission overhauling, it must have a minimum static water depth of 24 inches (600) below the invert of the interceptor outlet and a minimum static water capacity of 6 cubic feet.

This regulation applies to facilities where not more than three vehicles are serviced. For each additional vehicle up to and including ten, 1 cubic foot of static capacity shall be added. For each vehicle over ten, an additional 0.25 cubic foot shall be added.

Vehicle storage and servicing. Where motor vehicles are serviced and stored, an oil interceptor shall be installed with a static water capacity of 1 cubic foot for every 100 square feet of area to be drained. The oil interceptor shall have a minimum static water level of 6 cubic feet.

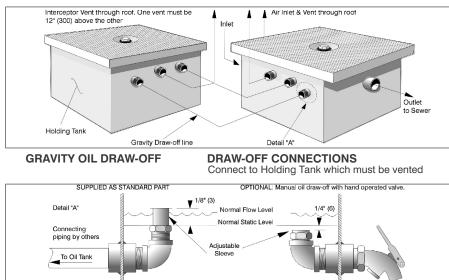

Mechanical car washing . In facilities designed especially for mechanical washing of motor vehicles, a sand and gravel interceptor shall be installed to receive the waste water from all washing facilities. A minimum static water level of 2.5 feet and a minimum static water capacity of 50 cubic feet shall be maintained.

Where motor cleaning services are rendered at mechanical car washing facilities, an oil interceptor shall be installed in that section of the drainage system which receives waste water from this operation.

Vehicle storage. In motor vehicle storage facilities, a combination interceptor-drain shall be installed with a static water level of 1 gallon for every 100 square feet of area to be drained.

Manual car washing. In a one-car washing facility, a combination interceptor-drain shall be installed with a minimum static water capacity of 30 gallons.

Manual Valve

OIL DRAW-OFF

Oil draw-off funnel is adjustable to the gravity height of oil and gallon per minute flow. It leads in to oil discharge pipe, from which suitable disposal of oil can be made in the most economical way.

After interceptor is installed, establish operating water level by running water through interceptor at maximum flow rate expected. Adjust vertical draw-off pipe 1/8" (3) to 1/4"(6) above water line. Periodic checking of this level after interceptor is in operation will assure proper functioning of the oil draw-off. If drawn off oil contains any water, raise vertical draw-off pipe until only oil flows from interceptor.

(Dimension) Denotes Millimetres

204

Design and dimensions are subject to modification. Prices do not include applicable taxes.

N.B. Operate manual draw-off only when flow has stopped through interceptor.

COVER SHROUDS for 4 to 100 US G.P.M PDI GREASE INTERCEPTORS

The shroud provides support for the interceptor and adjustability of the inlet and outlet dimensions to match drainage piping where necessary. The shroud can be set in the slab at the time of pouring. The shroud is secured and suspended in the slab by its anchoring flanges. The interceptor is easily accessible for cleaning and inspection simply by removing the cover that sits flush with the floor.

MI-CS Series supplied with one interior & one exterior angle support bracket per side. Interior angle bracket to support interceptor (purchased separately), exterior angle bracket to form anchor flange.

NOTE: The "C" dimension is with the support brackets in the top set of holes. Increase this dimension by "D" for each set of holes the support brackets are moved down, to a maximum of five sets.

NOTE: *75 & 100 GPM require 2 lids.

NOTE: Optional holding tank (SUFFIX-HT) may be required. Holding tank is same size as interceptor. Check with local code authorities.

MIFAB is a recognized industry leader in the field of interceptor design and production. As such, we offer a variety of specialized options and site-specific applications too numerous to list in this price guide. For features such as sacrificial anode packs, all stainless steel construction and a variety of other special features, please see our Engineering Catalog or consult your local MIFAB representative.

VIIFAB

MIFAB is a recognized industry leader in the field of interceptor design and production.

As such, we offer a variety of specialized options and site-specific applications too numerous to list in this price guide. For features such as sacrificial anode packs, all stainless steel construction and a variety of other special features, please see our Engineering Catalog or consult your local MIFAB representative

Optional high level alarm: Suffix -HLA, high level alarm - Add (\$11,766.00 all Models). Suffix -AL, aluminum lid - (MI-0-HU-A to MI-0-HU-3, \$3,223.00), (MI-0-HU-4 to MI-0-HU-8, \$4,476.00), MI-0-HU-9 to MI-0-HU-14, \$7,161.00). Suffix -T for threaded inlet and outlet connections - Add \$133.00 for 2", \$266.00 for 3", \$531.00 for 4", \$664.00 for 6". Suffix -AP for anode pack - \$2,790.00

MI-HEL

HELIPORT FUEL SPILL INTERCEPTORS

The MIFAB® MI-HEL heliport fuel spill interceptor is designed for use where there is the potential of an aircraft fuel leak entering the storm sewer system, (such as a roof top helipad), where the regular roof drains are connected to a municipal storm sewer system. The MI-HEL is constructed from high strength 1/4" plate steel and features: outlet vent connection, internal vent connection, gasketed access covers with stainless steel bolts, 2" fuel drain connection, 1" fresh water inlet supply connection with gate valve, back flow preventer, automatic water level controlling float valve, external sight glass level indicator with drain cocks, 2" interceptor drain plugs, channel support rails and body corner lifting lugs. The unit is regularly furnished with a two part epoxy interior and exterior coating.

AUTOMATIC RECOVERY GREASE INTERCEPTOR MI-G-AD

MI-G-AD

The MI-G-AD Series is an automatic recovery grease interceptor that is self cleaning and requires minimal maintenance. The unit intercepts solids with an internal sediment bucket and extracts free floating oil and grease from the unit automatically into a separate holding compartment.

The MI-G-AD Series should be used in large restaurants, kitchens, institutions, industrial facilities such as food processing and packaging plants where fats, oil and grease (FOG) drains into the wastewater.

The MI-G-AD includes a stainless steel body with a deep seal trap, sewer gas stopper, air relief bypass, grease and oil collection container, 24 hour timer with heating element and automatic skimming drum.

MI-E-G

4 TO 50 US G.P.M. ELECTRONIC GREASE INTERCEPTOR

MIFAB's electronic grease interceptor monitors the grease level within the interceptor. A control panel built into a standard electrical box consists of a multi-level LED display that alerts the operator to the current grease level. A green light on the control panel indicates normal operating conditions. At 50% grease storage capacity, the green light will change to yellow. At 75% grease storage capacity, the yellow light changes to red, the alarm will sound, and the inlet will be closed by a motorized valve. The closed inlet prevents additional grease from entering the interceptor and from discharging into the piping system. The operator must remove the lid of the interceptor and remove the accumulated grease and clean off the grease sensing probe to ensure that the motorized valve opens and regular operation can resume. A back-up battery ensures continued operation during short power failures and closes for safety during extended failures. The control panel and internal controls are pre-wired by MIFAB. 115 volt main to 24 volt transformer and low voltage wiring from the control panel to probe inside of the interceptor to be provided by others.

MIFAB is a recognized industry leader in the field of interceptor design and production.

As such, we offer a variety of specialized options and site-specific applications too numerous to list in this price guide. For features such as sacrificial anode packs, all stainless steel construction and a variety of other special features, please see our Engineering Catalog or consult your local MIFAB representative.

NOTE: The "A" and "B" dimensions represent the largest dimension of the interceptor. Since the lid overhangs the body by 1/2" (13) on all sides, deduct 1" (25) from the stated dimensions in the charts above to determine the actual body length & width.

NOTE: The"C" dimension is from the center of the inlet/outlet (invert) to the top of the interceptor. Inlet & outlet "C" dimensions are always the same.

FIXTURE CARRIERS

CARRIER FACEPLATE

The faceplate is lacquered cast iron heavy duty and invertible for use with siphon jet or blowout water closets.

slots accommodate the full range of

standard and wheelchair roughing-in

heights. It slides into the groove in the

structural feet to form a rigid assembly.

Breakaway tabs and elongated mounting

STRUCTURAL FEET

The feet are heavy duty cast ductile iron and invertible. No distinction is necessary between right and left hand. Each foot wraps around the specially formed edge of the carrier body extending only 7/8" (22) beyond the faceplate. This wrap around design allows for better seating with a continuous adjustment slot that covers the full mounting range. Slots at the top and bottom provide additional means to install the feet. The 18" (460) height covers most mounting requirements for both standard and ADA water closets.

EXTENSION

The extension includes a test cap and N.P.T. (tapered) threads. It is made of ABS plastic. The standard length is 8" (200) long and covers a 1" (25) minimum to 6 1/4" (160) maximum range. After system testing, the extension is easily cut off to meet the installation requirements.

HARDWARE

The hardware is cadmium plated, with chrome plated MIFAB cap nuts.

FITTING GASKET

The gasket is elastomer and is designed with a raised bead to provide fitting. A single anchor bolt secures the a positive watertight seal between the fitting and carrier body. It is held in place at the fitting opening, eliminating awkward handling when attaching the carrier body to the fitting.

OPTIONAL ANCHOR FOOT

The anchor foot is heavy-duty lacquered cast iron, which provides three-point support. Adjustable threaded rod attaches the foot to the foot to the floor. (Specify suffix -3)

Design and dimensions are subject to modification. Prices do not include applicable taxes.

Fixture Carrier Selection Guide

ADVANTAGES OF OFF-THE-FLOOR PLUMBING **FIXTURES**

Off-the-floor plumbing fixtures are easily the most widely used plumbing fixture in commercial building today. As the name implies, no part of the fixture touches the floor of the installation. The fixture is mounted to steel studs protruding through the wall from a carrier support in the pipe chase. This carrier support is anchored to the chase floor and receives the fixture load. The advantages of off-the-floor fixtures, as opposed to floor mounted fixtures, are numerous. The most obvious advantages installation, maintenance, sanitation and aesthetics are presented here.

1. INSTALLATION

The installation of floor mounted fixtures can be costly and time-consuming to the job. Floor mounted fixtures require slab penetration and sleeving at each location. The resulting waste piping is run under the slab, thus creating a need in multi-story buildings to provide a false ceiling for concealment purposes. The piping assembly also requires special consideration as it is usually accomplished piece by piece during installation. By comparison, the off-thefloor fixture installation does not involve slab penetration in the toilet room. Since all piping is behind the wall, there is no need for ceiling modification. And off-the-floor support systems are fairly modular in design, allowing for prefabrication, on or off site, before installation. All this contributes to substantial savings in time and cost.

2. MAINTENANCE

Both floor mounted and off-the-floor plumbing installations may have similar mechanical service requirements; however, due to their inherent characteristics, the off-the-floor installations are generally considered easier to service and maintain.

3. SANITATION

The most important consideration of toilet room design is sanitation, the ability to maintain a clean environment. The floor mounted fixture installation directly opposes this consideration. The base of the fixture magnetically attracts dirt that is difficult, if not impossible, to remove. Floor deterioration in the area of fixture contact also contributes to unsanitary conditions. The clearance that the off-the-floor fixture installation provides immediately resolves the problems of floor mounted design. Complete sanitation is easily maintained with normal cleaning.

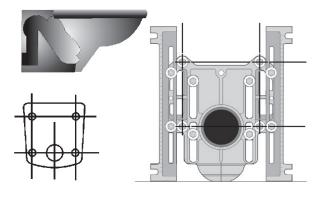

4. AESTHETICS

Aesthetic appeal is an important consideration in deciding upon fixtures. The clean, smooth lines of off-the-floor fixtures complement today's contemporary toilet room designs.

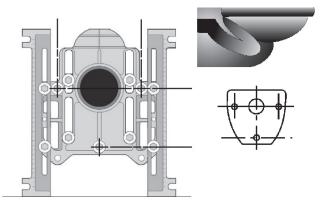

TYPES OF WATER CLOSETS

There are two types of water closets commonly used in commercial installations: siphon jet and blowout. The MIFAB closet carrier can be used to mount either type.

SIPHON JET WATER CLOSETS use siphonic flushing action to evacuate the bowl. This is a quiet and economical type of flushing action that provides quick, efficient results. The large water surface area of the bowl, for better sanitation, is another desirable feature of the siphon jet water closet. The siphon jet closet mounts to the carrier with four mounting studs.

BLOWOUT WATER CLOSETS use a direct jet stream for bowl evacuation. This type of flushing action is rapid and forceful and primarily used in heavy duty installations such as stadiums and terminals. Due to this powerful flushing, the blowout water closet is noisier in operation than the siphon iet. The blowout closet mounts to the wall with three mounting studs. NOTE: It is highly unadvisable to mount Blow-out type water closets in a "Back to Back" type installation.

Fixture Carrier Selection Guide (Cont'd.)

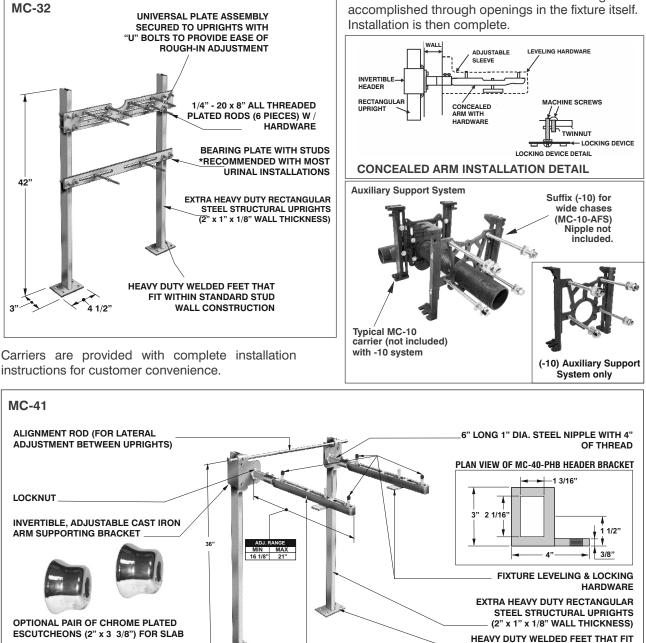

FIXTURE CARRIERS

PLATE TYPE CARRIERS

The MIFAB plate type floor mounted fixture carriers have been developed to accommodate the majority of hanger plate supported fixtures such as urinals, plate type lavatories and water coolers for support independent of the wall. The MIFAB universal backing plate provides adjustment for a wide variety of fixtures from most manufacturers.

CONCEALED ARM CARRIERS

MIFAB concealed arm lavatory carriers can be used with any lavatory fixture that has been drilled for concealed arm supports. This concealed arm support consists of ductile iron arms with leveling and locking hardware. These arm assemblies are available in two lengths to accommodate standard and wheelchair fixtures. After carrier installation and completion of wall construction, final adjustment can be made to the arm and sleeve assembly. Then the fixture is slid over the arms. Level and locking are accomplished through openings in the fixture itself.

Design and dimensions are subject to modification. Prices do not include applicable taxes. Visit www.mifab.com for the most recent product information.

CONSTRUCTION

Fixture Carrier Suggested Specifications

WALL HUNG CLOSET CARRIERS

Wall Hung Water Closets shall be supported independently of the wall by MIFAB Series MC-1(*) carrier fittings with ductile iron adjustable foot supports. Where space permits, waste piping shall be run horizontally above the floor and MIFAB Series MC-10 series single or double carrier fittings shall be used. Connection to the stack in a horizontal run shall be a TY or a MC-13 carrier fitting. Where pipe space is limited, or where single fixtures are installed use MIFAB MC-14 Series. Where fixtures are located on common waste/vent stacks use MIFAB Series MC-15 series carrier fittings.

* Series number denotes horizontal, vertical adjustable or vertical fixed water closet carrier.

WALL HUNG URINALS Wall

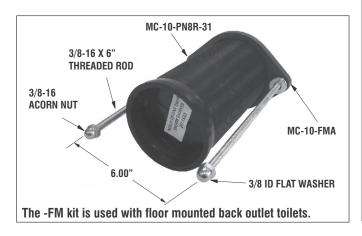

Hung Urinals shall be supported independently of the wall by MIFAB Series MC-32 Series Urinal Carrier with two supporting plates, heavy-duty rectangular steel uprights with integral welded feet.

WALL HUNG LAVATORIES

Wall Hung Lavatories shall be supported independently of the wall by MIFAB Series MC -40 Series Lavatory Carrier with heavy duty rectangular steel uprights with integral welded feet. Wherever possible, fixtures shall be supplied with access for concealed arm supports and MIFAB Series MC-41 with cast ductile iron arms shall be used. Supply chrome plated escutcheons on slab type lavatories. Where fixtures are not available with access for concealed arms, fixtures shall be supported by MIFAB Series MC-31 or MC-32 for plate supported lavatories, or MC-40 for exposed arms.

WHEEL CHAIR LAVATORIES

Wheel chair lavatories shall be supported independently of the wall by MIFAB Series MC-42 Lavatory Carrier with extended cast ductile iron concealed arms and heavy duty rectangular steel uprights with integral welded feet.

VIIFA

TYPICAL CLOSET CARRIER LAYOUT

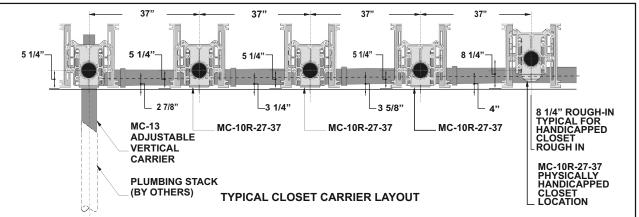

ANSI Standard A-112.19.2, Vitreous China Plumbing Fixtures, paragraph 5.1.3.3 states that a "Physically Handicapped" water closet is a siphon jet design that is positioned 18" from the finished floor to the top of the rim.

The closet carrier layout detailed below has the following common installation dimensions:

- * Waste piping is pitched at 1/4" per foot * Centerline of the regular water closet outlets to the finished floor is 5 1/4"
- * Regular water closet rim to the finished floor is 15 1/4"
- * Centerline of the physically handicapped water closet outlet to the finished floor is 8 1/4"
- * Physically handicapped water closet rim to the finished floor is 18"

The regular water closets are supported by MIFAB's MC-10-27-37 long barrel carrier fittings that are produced with a 37" long barrel. This can save the installer time and material by not having to purchase and cut waste pipe to install between standard "short barrel" carrier fittings (MC-10 Series) that are 13" long.

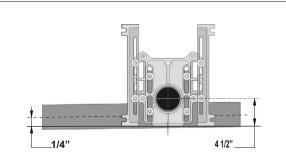

Note that physically handicapped water closets can also be installed onto the MC-13, vertical, adjustable carrier by positioning the centerline of the 4" female threaded nipple connection in the faceplate 8-1/4" from the finished floor.

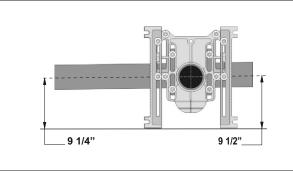

Up to a maximum of ten fixtures may be installed on either side of the stack fitting provided that the waste drain piping is pitched 1/8" per foot.

ADJUSTMENT RANGE OF MIFAB'S MC-10 AND MC-13 SERIES CARRIER FITTINGS

Lowest fixture outlet and drain line position

Highest fixture outlet and drain line position

CENTER LINE OF FIXTURE OUTLET HEIGHT FROM	CENTERLINE DRAIN LINE POSITION From the finished floor			
FINISHED FLOOR	MINIMUM	MAXIMUM		
4 1/2"	4 1/2"	1/4"		
4 3/4"	4 1/2"	1/2"		
5"	4 3/4"	3/4"		
5 1/2"	5 1/4"	1 1/4"		
6"	5 3/4"	1 3/4"		
6 1/2"	6 1/4"	2 1/4"		
7"	6 3/4"	2 3/4"		
7 1/2"	7 1/4"	3 1/4"		
8"	7 3/4"	3 3/4"		
8 1/4"	8"	4"		
8 1/2"	8 1/4"	4 1/4"		
8 3/4"	8 1/2"	4 1/2"		
9"	8 3/4"	4 3/4"		
9 1/2"	9 1/4"	5 1/4"		

Note: For all rough-in heights, the closet carrier fitting has a 4" vertical adjustment range. This is to ensure that there is enough drainage pitch on long runs.

Design and dimensions are subject to modification. Prices do not include applicable taxes.

SHIFT and LIFT Universal Water Closet Carrier Offset Kit

You have told us how frustrating and expensive it is when the ADA water closet is less than 18" from the center to the finished wall.

You can now offset the fixture without having to tear out the carrier! The MC-10 Series is tested with the "Shift and Lift" offset hardware package to support a 500 lb. Load with the rear anchor support.

LIST PRICE - P.O.A.

MIFAB WATER CLOSET FEATURES AND BENEFITS

Features	Benefits
Most compact full featured carrier available.	Legs and face plate always factory assembled to save assembly labor. Legs are 18 inches high for ADA closet rough-in. Legs are invertible - no rights or lefts - same for both. Legs have 2 slots for anchor bolts in case of obstacle in floor (ie rebar) - only one bolt required.
Trim and fitting boxed separately.	Ease of handling and storage.
Bolts for closet height adjustment are located on front faceplate.	Easy access to allow for adjustment on water closet/fitting height. Labor savings by using an air gun with a battery of carriers. Stud obstruction eliminated with bolts on front of faceplate saving labor and time.
Two ½ inch tappings on back of faceplate.	Allows strut to be bolted flush to back of faceplate and notches in legs. Use of cushion clamp in strut allows for 4¾" inch rough-in from centre of cushion clamp to centre of nipple, allows for flush valve water supply rough-in. Anchor strut provides support for any additional rough-in. Strut has multifunctional use. Holdrite [®] bracket fastens over hardware rods that support the water closets - can be used for 4¾" inch flush valve water supply rough-in.
Breakaway tabs on faceplate.	For fitting height adjustment. Very common dimensions to center of water closet bowl when breaking off each tab. Rough-in height adjustment: Bottom of face plate to centre = 7 inch centre 1st cut = $4\frac{1}{2}$ " cut inch centre 2nd cut = $5\frac{1}{4}$ " inch centre
Faceplate has additional 5/8 inch tapping.	The same faceplate to be inverted for blowout water closet installation.
Faceplate with O-ring.	Can receive any of 3 different nipple designs: - rolling threaded nipple - tapered nipple with running threaded horn adjustment - standard tapered threaded nipple
Feet are 2¾" inches deep	Allow carrier legs to fit in smaller stud channel.
Narrow pipe chase installation.	9½" inches from front of legs to back of the fitting, plus 1 inch for rear anchor support. 6½" inches from back of legs to the back of fitting, plus 1 inch for rear anchor support.
37 inch long barrel - MC-10-27-37	Minimal up charge. Savings on cost of pipe, cutting pipe and no hub bands versus the competition. Always supplied with 2 inch waste connection auxiliary inlet to receive lavatory and/or urinal waste. Eliminates the need for a "Y" and/or "T" fitting if a lavatory and/or urinal are required.
3/4 37 inch wider bolt slots for long barrel fitting	Provides necessary adjustment to achieve required slope.
Threaded rods protective casing.	Protects threads during installation
Closet support rods have double tightening nut.	One for siphon jet – 4 studs. Second for blowout toilet – 3 studs (by turning faceplate upside down). Ensures steadfast connection.
1 inch leg notches from ground	Grip a $1\frac{1}{2}$ " inch angle iron to transport a battery of carriers to the job site.
1/2 inch increments on legs/faceplate.	Visual reference for toilet height adjustment.
All tapped holes are greased.	For ease of installation for threaded rods.
Bowl saver washer	Allows closet bowl to fit closer to the finished wall. Reduces bowl breakage.
Fits flush with finished wall	This allows for less caulking and less chance to chip, damage or break toilet bowl.
Plastic washer prevents toilet bowl from hitting on steel nut.	Eliminates the need to cut a larger hole in finished wall and or ceramic tile to install 5/8" nut on threaded rod. This saves labor and repairs to finished wall. Saves money.

MC-70	P.O.A.	P.O.A.	P.O.A.	P.O.A.

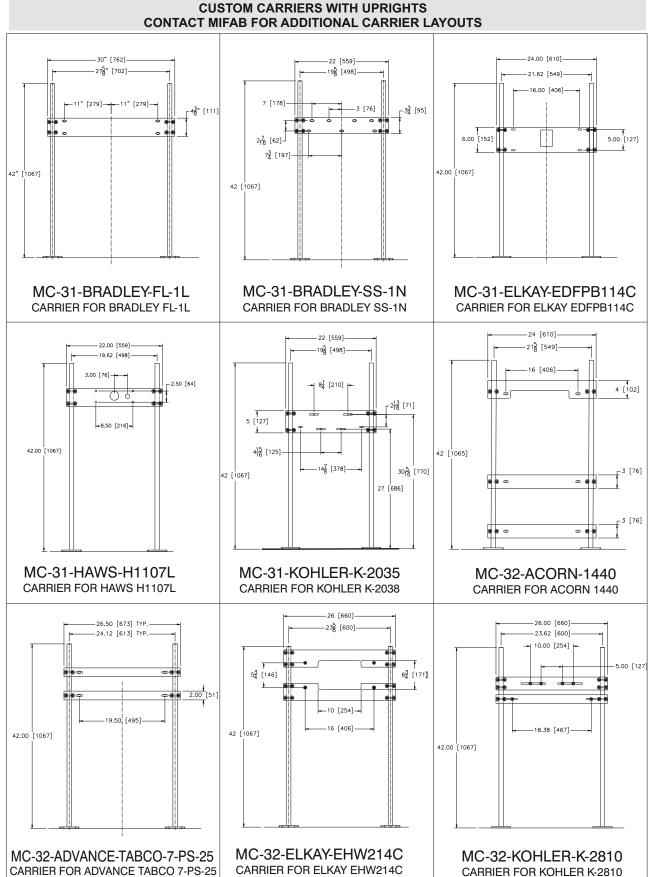

The MIFAB MC-70 Eastern Style Water Closet is manufactured from Type 304 stamped stainless steel (1.2mm thick). It is manufactured with integral non-skid foot pads and ½" bowl wash down connection heads (provides 2 gallons of water flow). The MC-70 is self supporting and does not require external mounting hardware. It should be installed flush with the finished floor providing floor drainage into the bowl. Non potable water (sea water or brackish water) may be used to flush the bowl. Specify -73 for a fabricated Type 304 stainless steel p-trap.

(R)

HYDRANTS

DUAL SIZE INLET CONNECTION

MIFAB's hydrants are manufactured with a combination 3/4" female and 1" male threaded "inlet" connection for maximum installation flexibility.

VACUUM BREAKER

MIFAB's MHY-10, MHY-20 and MHY-60 hydrants are manufactured with a vandal resistant integral vacuum breaker that is tested and certified to the A.S.S.E. 1019-B Standard.

POLISHED CHROME FACE PLATE

MIFAB's wall hydrants are manufactured with a polished chrome plated face plate for a high quality and endearing appearance.

DRIP LIP

MIFAB's hydrant boxes are manufactured with a "drip lip". When the hydrant is turned off, and the hose is removed, the water that is within the hydrant will drain into the box and down the drip lip, away from the wall and onto the ground. This eliminates unsightly stains on the wall below the hydrant box which is typical with others.

(MHY-20 ILLUSTRATED)

CASING

MIFAB's hydrants are manufactured with a heavy duty brass casing. This offers the contractor a solid and consistent shape to attach a wall clamp to.

NICKEL BRONZE BOX

MIFAB's encased wall hydrants are provided with a heavy duty cast nickel bronze box with hinged locking cover for maximum durability. Optional cast Stainless Steel box will not discolor due to oxidation. Specify suffix -3.

MIFAB Hydrant Selection Guide

MIFAB HYDRANT SELECTION GUIDE

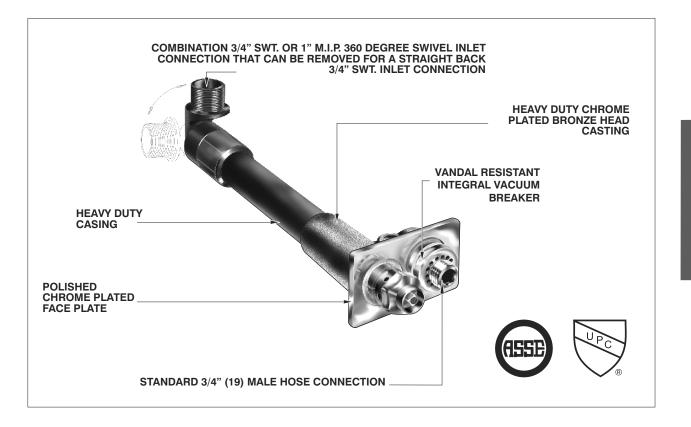

MIFAB hydrants are engineered to control the supply of water in various types of applications. Due to a wide range of uses, careful consideration should be taken when selecting and specifying the hydrants. The information provided below will aid the specifier in selecting the correct hydrant for the application considering such issues as temperature, recessed boxes, vacuum breaker / backflow preventer and optional variations.

WALL HYDRANTS

The most common installation area for hydrants is in the wall. They may be installed either inside or outside of commercial buildings and serve numerous purposes including watering plants and shrubs and washing floors or parking areas. Non-freeze wall hydrants are available in various lengths to accommodate different wall thick - nesses to ensure that the inlet connection is inside the heated building to prevent freezing. Sometimes, non-freeze wall hydrants must be concealed entirely within the wall. In these instances, an overall dimension can be specified. This dimension measures from the back of the face of the hydrant to the end of the inlet connection. Extra precautions must be taken to properly insulate the valve body to protect against freezing. In addition to the standard wall hydrant, MIFAB offers a combination hot and cold water hydrant that allows connection to both hot and cold supplies. It is used to supply tempered water. See MIFAB MHY-45.

NARROW WALL HYDRANTS

Narrow wall hydrants are installed in areas where the entire product must fit within a 4" thick wall. A unique feature on the inlet supply of the MIFAB hydrant permits the installer to rotate the connection to any position to connect to the water supply line. The narrow wall hydrant may also be encased to gain all of the advantages of installing the hydrant in a recessed box. MIFAB's MHY-55 encased narrow wall hydrant has an overall length of 3 5/8" to ensure that it will still fit within a 4" thick wall.

MIFAB Hydrant Selection Guide Cont'd.

RECESSED BOXES

HYDRANTS

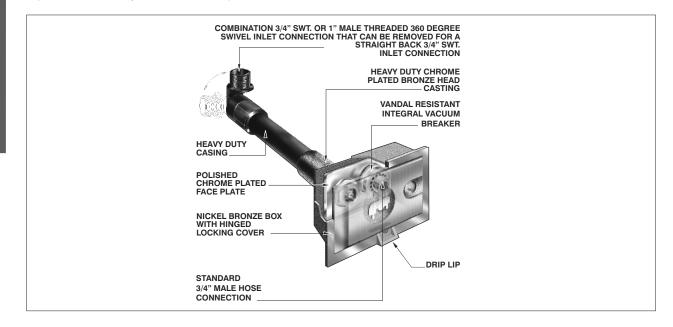

MIFAB's recessed hydrant boxes are made with a flange that covers the rough opening and is installed flush against the exterior wall surface. The hinged locking cover conceals the hose nozzle and all of the operating parts. The advantages of the flush recessed box:

- Arecessed box provides roughing in the box flush with the exterior wall for a pleasing appearance.
- The hose connection and operating mechanism are concealed within the box instead of protruding from the wall surface.
- The box has a locking hinged cover that will prevent unauthorized access and vandalism of the operating mechanism and hose nozzle. The same key that operates the hydrant also unlocks the box. This key is a special 3-3/4" long to ensure that the operator's fingers are outside of the hydrant box while operating the hydrant. Typically, short keys are provided by others that result in the operator's fingers being scraped or cut by the inside of the hydrant box.

MIFAB hydrant boxes are standard in a satin finished nickel bronze material. Polished chrome plated and cast stainless steel, are also available. The open face hydrant should be specified when the operating mechanism and hose nozzle is preferred to be exposed and may extend beyond the finished wall. This hydrant should be installed in a concealed location or where security is provided. MIFAB's MHY-10 and MHY-30 hydrants can be easily attached to the hydrant box. The hydrant is inserted through the front of the box until the back of the faceplate rests flush against the inside of the box. Two set screws on the top and bottom of the back of the box are used to tighten the hydrant securely into the box.

MIFAB has engineered several unique features into its' wall hydrant boxes.

- A"drip lip" on the exterior of the hydrant box accumulates water that results from the closing of the hydrant. This residual water drips from the lip onto the ground clear of the wall. Standard competitive designs cause unsightly oxide stains on the wall.
- The bottom of MIFAB's hydrant boxes are solid. There are no slots or grooves for water to drain back into the wall and cause damage.
- The boxes are also available with four /" x 1" slots (suffix -S) (one at each side and two on the top of the box) and three mounting brackets (suffix -BR) for easy installation by the contractor into the frame or ladder system. Too often, contractors have difficulty installing hydrant boxes into walls because nothing is provided to secure the box to the wall. Many contractors go to considerable expense to fabricate their own hydrant box mounting devices. MIFAB's hydrant boxes eliminate these extra costs and ensure that the installation and operation of the hydrant box is simple.

<u>MIFAB</u>

MIFAB Hydrant Selection Guide Cont'd.

GROUND, POST and YARD HYDRANTS

Ground hydrants are available for buried applications. The hydrant control and hose connection are housed in a box which is installed flush with the ground or floor. These hydrants are standard with a 1/8" tapped hole in the valve body to drain water from the casing after operation. The valve body should beset in a bed of gravel so that water drained from the casing can leach into the ground. Some locations that require nonfreeze ground hydrants cannot permit water draining from the 1/8" tapped hole. Parking garages, plazas, and roof decks used for recreational purposes are obvious examples. In these types of applications, the valve body will protrude into a finished area that is not subject to freezing. A drain line can be connected to the 1/8" tapped hole to carry away water. The depth of bury should be specified to match the hydrant to the water supply piping which must be below the frost line. Post hydrants are similar in application except that the ground hydrant outlet is recessed below ground and the post hydrant series as an above ground outlet. Yard hydrants are typically used in parks, recreational areas and other places that require both clean, uncontaminated water and the assurance that the water system will not be polluted through the hydrant installation. The yard hydrant drains residual standpipe water while protecting against cross connection with groundwater.

WALL FAUCETS

Wall faucets are required in restrooms, mechanical rooms, and storage areas to prevent the evaporation of water from floor drain traps. Floor drains in these areas often do not receive enough water from the cleaning of the floors to maintain the water seal in their traps. A reliable supply of water is supplied by the MIFAB wall faucet, when operated by maintenance personnel. Typically, they are installed underneath lavatories or counters in restrooms. Wall faucets are also commonly used in moderate climate residential applications and are available with or without an enclosed box. Three different finishes are available: cast brass, rough chrome plated and polished chrome plated. Four different handle options are available: clear plastic wheel handle, brown plastic wheel handle, cast iron wheel handle and loose operating key. Also, 1/2" and 3/4" F.H. inlet supply connections are available.

<u>⊹ MIFAB</u>®

MIFAB Hydrant Selection Guide Cont'd.

MHY-35 ILLUSTRATED

TEMPERATURE CONSIDERATIONS

One of the most critical factors in determining the correct hydrant to specify is how ambient temperature will affect its' operation. Moderate climate hydrants are not self draining and should only be specified in heated areas or "mild climates" where freezing temperatures are not a possibility. Non freeze wall hydrants may be installed outside or on outside walls where freezing temperatures may occur. To prevent these hydrants from freezing, the actual valve mechanism susceptible to freezing is positioned away from outside temperatures. Also, standing water is drained from the hydrant after each use via a built-in drainage system. Misapplication of a hydrant regarding surrounding temperature could result in water damage or costly repairs to the hydrant or water piping.

VACUUM BREAKER / BACKFLOW PREVENTER

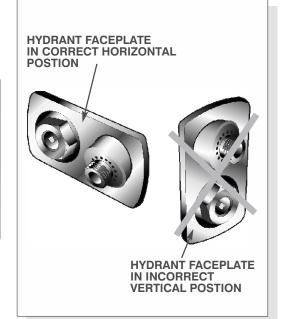

A vacuum breaker or backflow preventer is an important consideration in preventing fluids from siphoning back from the hose connection into the hydrant or water supply. All MIFAB hydrants are available with vacuum breakers that are A.S.S.E. certified.

When the hydrant valve is open, the supply of water flows through the hydrant and the vacuum breaker automatically opens to allow the water to flow through the hose connection. Water from upstream can siphon back into the hydrant if the hydrant valve is left open and there is no vacuum breaker. A vacuum breaker will automatically close to allow water to drain through it's air vents and not back through the hydrant. When the hydrant valve is closed, the water left in the hydrant is allowed to drain out of the water relief ports surrounding the operating mechanism while the vacuum breaker automatically closes to prevent backflow from the hose.

The preceding paragraph is very important because it describes the draining of the water left in the hydrant body after the hydrant valve is closed. The draining function is critical because water could freeze if it is left inside of the hydrant body. The hydrant must be installed in the correct position to correctly drain and eliminate the possibility of freezing.

All wall hydrants must be installed in a horizontal position. If the hydrant were to be installed with the face plate in the vertical position with the vacuum breaker on the bottom, the vacuum breaker will not permit water to drain from the hydrant and eventually cause the excess water in the hydrant to freeze.

MIFAB Hydrant Selection Guide Cont'd.

SUGGESTED APPLICATIONS FOR MIFAB HYDRANTS

Wall hydrants	Non-freeze	Moderate climate
Apartments	MHY-10	MHY-30, MHY-35
Cleaning Areas Slop sinks	MHY-10	
Commercial / Multi Family, Narrow wall construction		MHY-30
Hospitals, Institutions, Schools	MHY-20	MHY-35
Office Buildings	MHY-20	MHY-35
Retail Stores	MHY-20 MHY-10	MHY-35
Ground hydrants	Non-freeze	Moderate climate
Agricultural, Farms	MHY-65, MHY-68	
Gardens	MHY-60, MHY-60-HSB, MHY-65, MHY-68	MHY-35
Industrial	MHY-60-HSB	
Malls, Supermarkets	MHY-60	MHY-35
Recreational Areas, Parks	MHY-60, MHY-60-HSB, MHY-68	
Stables, Livestock Areas	MHY-65, MHY-68	

Note: Any of the non-freeze hydrants may be used in moderate climates

FLOW RATES, OPERATING PRESSURES AND TEMPERATURE RANGE

MIFAB's 3/4" hose connection wall and ground hydrants provide a flow of approximately 10 GPM under average water line pressures. The flow rates are in excess of 100 GPM for the 1-1/4", 1-1/2", and 2" hose connection hydrants.

The maximum static operating pressure is 125 psi and the minimum running pressure is 8 psi for MIFAB's wall and ground hydrants.

The maximum temperature range is 130 degrees Fahrenheit and the minimum temperature range is 33 degrees Fahrenheit for MIFAB's wall and ground hydrants.

MIFAB

MHY-CIA-18-A (FOR ALL HY-1000, HY-2000, MHY-10 and MHY-15, MHY-16, MHY-20, MHY-25 AND MHY-26) COMPLETE INTERNAL ASSEMBLY REPLACEMENT INSTRUCTIONS - HYDRANT REPAIR KIT

This kit includes: 2-plunger assemblies; 2-worm stem assemblies; 2-lock nuts; 1-head nut seal; 1-tube thread locker; 1-tube lubricant

REMOVAL

Shut off water supply to hydrant and relieve water pressure. Remove hydrant stem assembly. (Do not disassemble. The old stem must remain assembled for reference dimensions.) Remove the old head nut seal.

Note: The plunger tips provided in this kit will replace all old versions of plunger tips. See inset.

MEASUREMENT

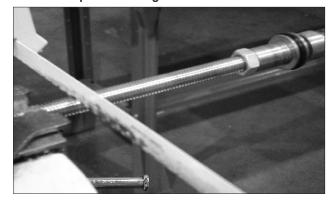

Fully thread the appropriate worm stem assembly on to the 4-1/4" uninterrupted threaded end of the fully threaded rod. Lay the old stem assembly next to the new stem, aligning the

o rings on the worm stem assemblies.

Mark the groove in the threaded rod that is closest to the end of the old plunger tip, but not past the plunger end.

Using the appropriate holding fixture and a 32TPI hack saw, cut the threaded rod to the appropriate length.

Note: The undercut grooves in the threaded rod will guide the hack saw blade without the need for thread end "clean up" after cutting. See inset.

ASSEMBLY AND ADJUSTMENT

Remove the worm stem assembly from the cut rod and thread the two lock nuts onto the rod approximately 1" inward from each end.

Apply thread locker to the two ends of the threaded rod (approx. 3/8" coverage) and a small amount to the internal threads of the plunger and worm assemblies.

Thread the worm stem assembly until seated fully and then thread the plunger assembly to match the length of the old hydrant stem assembly. (Remove excess thread locker.)

Note: Align the o rings of the two stems side by side and adjust the plunger tips to match.

Once the proper length has been attained, advance the lock nuts toward the two end assemblies and tighten with a 9/16" wrench

Generously apply lubricant to the plunger tip seals, o ring, and worm stem screw threads.

INSTALLATION

Install the new head nut seal into the body of the hydrant. Thread the worm screw fully into the head nut using a hydrant key.

Thread the head nut and stem assembly into the hydrant body and tighten.

Shut off the hydrant and open the water supply. Test the hydrant for proper function.

MI-GAP-NPB BRASS TRAP SEAL PRIMER AIR GAP FITTING

MIFAB's MI-GAP-NPB air gap fitting can be used with MIFAB's MR-500-NPB, M1-500-NPB, M2-500-NPB, MI-TSP-1-NPB, MI-TSP-2-NPB, MI-TSP-3-NPB trap seal primers and MIFAB's MI-DU Series distribution units. The MI-GAP-NPB performs the dual functions of backflow preventer and vacuum breaker.

Note: A vertical air	gap of twice the connection size is required by code.

(R)

TRAP SEAL PRIMERS

3 P.S.I. PRESSURE DROP

Only a three p.s.i. line pressure drop is required to activate the primer compared to five or ten p.s.i. by others. Lower water volume fixtures and faucets has resulted in lower line pressure drops. A three p.s.i. performance point ensures reliable water delivery to maintain the trap seal

SEDIMENT FILTER

A replacement stainless steel sediment filter prevents line debris from entering the primer. This can be replaced after wear and build up of debris to ensure maximum life and performance of the primer.

NO ADJUSTMENTS

The replaceable and repairable cartridge tubes inside of the body are factory engineered to deliver enough water to service three, six or ten floor drain traps without adjustment. This eliminates confusion during field installation.

VIEW HOLES

Four view holes permit easy inspection of water delivery. The holes are across from each other, enabling light at the opposite end to illuminate the performance of the primer.

NO PRECHARGE

MIFAB's trap seal primers can be disassembled in the field for easy cleaning and repair, without risk of losing a precharge.

MIFAB TRAP SEAL PRIMER SELECTION GUIDE

Trap seal primers are a necessity where floor drains are infrequently used and in areas such as mechanical and service rooms. In surprisingly little time, evaporation of water in floor drain traps will allow sewer gas to enter the interior of the building. Today's typical method of cleaning floors produces very little water that runs into floor drains. In mechanical rooms, warm dry conditions and air pressure changes caused by HVAC equipment may also serve to compromise the water seal. Trap seal primers provide a supply of water to replenish the deep seal or "P" trap of a drain to prevent sewer or potentially explosive methane gas from entering the area through the floor drains. They are installed on the potable cold water supply line, and react to water flowing in the line to trigger, either by turbulence or pressure drop. Once a triggering event occurs, the primer will release water that is piped to a trap primer connector on or near the "P" trap being maintained. The selection and specification of trap seal primers merits careful consideration. Outlined below are some of the factors to be aware of when planning to use trap seal primers effectively. Installation and local code requirements must be taken into account when specifying trap seal primers. The A.S.S.E. (American Society of Sanitary Engineers) trap seal primer standard #1018 is the key standard that relates to trap seal primers. MIFAB's M-500-NPB and MI-TSP-NPB trap seal primers are tested and certified to the A.S.S.E. 1018 Standard.

TYPES OF TRAP SEAL PRIMERS

There are four main types of trap seal primers. They include: continuous flow, pressure drop activated, fush valve operated and electronic.

CONTINUOUS FLOW TRAP SEAL PRIMERS

Continuous flow trap seal primers are the original style of trap seal primers. They are typically constructed of cast brass or bronze with a neoprene rubber poppet float on the inside that rises upward as water flows through the primer. When the poppet rises off of its seat, water flows from the primer, through the plumbing line connection, and into the floor drain trap. They are manufactured in either sweat, threaded or union connections and should be installed in a vertical position within the horizontal water supply line, at least ten inches above the floor drain trap that it serves. Continuous flow trap seal primers do not have any method of screening out line debris. This often results in their clogging and either flowing water continuously, or not at all. The volume of water that they discharge is directly related to the amount of water that continuously flows through them. For these reasons, pressure drop activated trap seal primers have become the selection of choice for specifiers.

ELECTRONIC TRAP SEAL PRIMERS

MIFAB's MI-100 Series of electronic trap seal primers are a pre-assembled electronic trap seal primer system programmed to maintain the water seal of floor drain traps. The device is made with an A.S.S.E. approved vacuum breaker, solenoid valve operated by a timer, shut off valve for maintenance and a manifold system to distribute water evenly to the desired floor drain traps. The design is programmed at MIFAB's factory with standard flush times. These flush times can be adjusted by the operator in order to discharge more or less water to the floor drain traps, depending on the installation and climate conditions. Applications include commercial buildings such as schools, hospitals, manufacturing facilities, and any other buildings that require floor drain trap seal protection. The distribution of water from the MI-100 to the traps avoids possible odors coming from the drains.

MPB-2019-USA

MIFAB

MIFAB TRAP SEAL PRIMER SELECTION GUIDE (Cont'd)

PRESSURE DROP ACTIVATED TRAP SEAL PRIMERS

Pressure drop activated trap seal primers are typically manufactured out of brass. They are made with a 1/2" M.I.P. inlet connection and a 1/2" F.I.P. outlet connection. They have an interior cartridge that seals when the line pressure is in a static state. When the line pressure drops as little as three p.s.i. (pounds per square inch) (caused by the flushing of a toilet, opening of a faucet, or any draw of water from the water supply line within a close distance to the primer) the interior cartridge will rise due to the pressure differential within the primer and a metered amount of water is discharged under pressure into the plumbing line connected to the floor drain trap. Pressure drop activated trap seal primers are supplied with a fine mesh stainless steel filter that will screen out debris to ensure that the cartridge is not clogged and that the water deliveries are uniform. The filter is easily accessible for quick cleaning or replacement. Three different cartridges offer three different water deliveries into the floor drain, depending on the number of floor drain traps served and the evaporation rate of the water in the floor drain traps. Assuming line pressure of 60 p.s.i, and a line pressure drop of 3 p.s.i., MIFAB's MR-500-NPB trap seal primer will discharge a one half ounce of water, the M1-500-NPB will discharge a full ounce of water and the M2-500-NPB will discharge a one quarter ounce of water into the floor drain P trap every time the line sure changes by 3 p.s.i.

FLUSH VALVE TRAP SEAL PRIMERS

Flush valve trap seal primers are installed below the flush valve and direct an amount of waste water discharged from the flush valve into a tube that connects to the floor drain trap to maintain the water seal. Their advantages are that the water used is already consumed by the flush valve operation, and this type of primer has no moving parts. Their disadvantage is that their location is determined by the location of the fxtures which may be too far away from the floor drains to be practical; unlike supply line mounted trap seal primers which can be more easily installed close to the floor drain trap to be primed. Many installations cannot use flush valve trap seal primers because the floor drain traps are too far away to be reached by the flush valve trap seal primer.

MIFAB

MIFAB TRAP SEAL PRIMER SELECTION GUIDE (Cont'd)

INSTALLATION CONSIDERATIONS

Continuous flow and pressure drop activated trap seal primers should be installed at least 12" above the floor drain traps for every 20 feet of distance to the drain to ensure that there is enough of a slope for the discharged water to flow to the traps. MIFAB recommends pre-priming the traps, as trap seal primers are meant to replace trap water loss through evaporation, etc. Pressure drop activated primers should be connected to the water supply line with a vertical elbow to limit line debris from entering and contaminating the valve. The primer itself should be installed vertically. Access doors should always be specifed to provide easy access to all trap seal primers. Trap seal primers have moving parts that will eventually wear or be compromised by line debris even in the best of circumstances. The access doors specifed should be large enough to provide "hand access" to the trap seal primer, related accessories and line shut off valve. For quick and easy repair, a line shut off valve and union connections are recommended directly before the trap seal primer on the water supply line. The closing of this valve will facilitate the cleaning and maintenance of the primer without having to separately shut off the building's water supply. Water supply lines should be flushed at least five times before the trap seal primers are initially installed to ensure that debris will not enter the primers and negatively affect their performance. Pipe dope and paste should never be used when installing trap seal primers in water supply lines because the fne residue from these adhesives will enter the trap seal primers and clog the cartridges. Install the trap seal primer as close to the source of the pressure drop as possible. Fixtures with a water restriction device may not cause a large enough pressure drop to activate the trap seal primer.

AIR GAP FITTING

Many local codes require the use of an air gap fitting underneath the trap seal primer (see MIFAB's MI-GAP-NPB product). The purpose of an air gap ftting is to provide a vertical space that is twice the diameter of the water supply connection in order to ensure positive protection against back flow. ANSI / ASME Standard A112.1.2 air gap in plumbing systems is written for the application of air gap fttings. It is recommended that air gaps be specifed for use in areas where splashing water from the air gap will not be objectionable or cause damage.

DISTRIBUTION UNITS

Distribution units can be installed underneath pressure drop activated trap seal primers to distribute water to up to ten floor drain traps that are in close proximity to each other. (See MIFAB's MI-DU product) Typically, distribution units are used when a men and women's restroom are located side by side with a common pipe chase between them. In this instance, one trap seal primer with a distribution unit dialed to the 2 setting can be used to service both floor drain traps. This eliminates a second costly installation procedure, shut off valve, access door and air gap ftting. MIFAB's distribution units are engineered so that they

do not need to be installed level to distribute water evenly and can be adjusted to serve either two, three or four floor drain traps with a single unit. Up to ten floor drain traps can be served by having one main distribution unit feed others below it. Contact MIFAB for layout information on distribution units serving multiple drains.

LINE SHUT OFF VALVE

The closing of this valve will facilitate the cleaning and maintenance of the primer without having to separately shut off the building's water supply. Water supply lines should be flushed several times before the trap seal primers are initially installed to ensure that debris will not enter the primers and negatively affect their performance. Pipe dope and paste should never be used when installing trap seal primers in water supply lines because the fine residue from these adhesives will enter the trap seal primers and clog the cartridges. Once installed, pressure drop activated trap seal primers should be cycled at least five times to ensure reliable operation. Quickly opening and closing the line shut off valve can accomplish this. Four view holes located directly across from each other at the bottom of the pressure drop activated trap seal primers allow easy observation of water discharging into the make up line that leads to the floor drain trap.

MIFAB MR-500-NPB, MI-500-NPB & VIEW PORTS (4) M2-500-NPB SERIES pressure drop activated REMOVABLE FILTER brass trap seal primer, with inlet opening of SCREEN LEAD 1/2" male N.P.T. and outlet opening of female FREE 1/2" N.P.T. Complete with four view holes and -NPB removable filter screen. Requires no adjustments and no air precharge. MIFAB'S Series of pressure activated trap seal primers (MR-500-NPB, M1-500-NPB and M2-500-NPB) can be connected to any cold water line, and will be automatically activated MIFAB when a valve or faucet, that is on the line, is Α opened. A pressure drop of three p.s.i. will activate all of the trap seal primers. MIFAB's Series of trap seal primers can be disassembled in the field. Their unique design permits filter replacement without affecting the performance of the primer. The "O" ring seals are tested for reliability temperature range of -40 degrees to 450 degrees F. The M-500-NPB Series of trap seal primers do not require adjustment. The <--- B operating range for all of MIFAB's Series of WRENCH FLATS trap seal primers is 20 to 80 p.s.i. All three models are listed with I.A.P.M.O. and C.S.A. and are tested and certified to the ISSE A.S.S.E. Standard 1018 and are so marked U.S. Patent # 6 152 164 M-500-UN

MI-DU TRAP SEAL PRIMER DISTRIBUTION UNIT

MIFAB's MI-DU trap seal primer distribution unit is engineered to receive a metered amount of water from a trap seal primer and distribute the water equally to either two, three or four floor drain traps. Choose from either 1/2" or 5/8" compression connections by indicating suffix (-500) for 1/2" or suffix (-625) for 5/8". The lid of the distribution unit has the numbers "2", "3" and "4" marked on it. The body of the distribution unit has a guide marker on the top of the body. The numbers and the guide marker are positioned by removing the three screws in the lid of the unit and rotating the lid to match the appropriate numbers with the guide marker to provide priming for the desired number of drains. Do not over torque the three lid screws when securing the lid back to the body. It is not necessary to install MIFAB's distribution unit perfectly level. The unique design will distribute water uniformly when out of level up to 5 degrees. **Model MI-DU is listed with I.A.P.M.O.**

MI-7

TRAP SEAL PRIMERS

Speciication: MIFAB MI-GARD® Series inline floor drain trap seal with UV resistant ABS plastic frame, silicone rubber sealing flapper and four flexible sealing ribs. Tested and certified to the ASSE 1072 Standard and listed with IAPMO. Specify connection size (1 1/2", 2", 3", 3 1/2", 4" or 6")

Function: Used in the outlet connections of floor drain bodies, or the inside of floor drain strainers to seal the opening to prevent odors, sewer gases and insects from entering up through the floor drain grate. The MI-GARD®'s four flexible silicone sealing ribs ensure easy installation into openings that have variations in size. The MI-GARD® will open to allow drainage and close when there is no water flow. The MI-GARD® can be used in either new construction or retro-fit applications where trap primers were never installed.

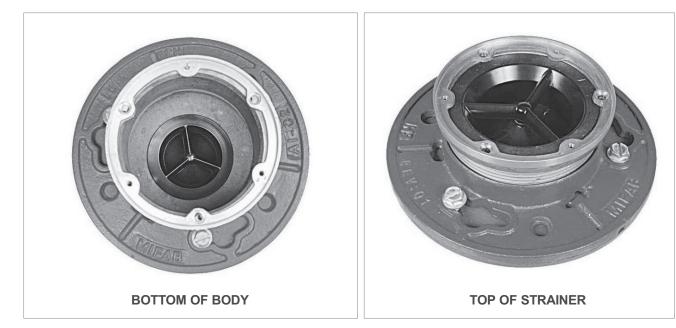

MODEL NUMBER	"A" (PIPE SIZE)	"B" (HEIGHT)
MI-GARD-1.5	1 1/2" (38)	2" (52)
MI-GARD-2	2" (51)	2" (52)
MI-GARD-3	3" (76)	2" (52)

WATER HAMMER ARRESTORS

WATER HAMMER ARRESTOR SIZING

Single and Multiple Fixture Branch Lines

The water hammer arrestor sizing procedure for single and multiple fixtures described below conforms to that established by the American Society of Sanitary Engineers in their Standard ASSE-1010. Selection of the water hammer arrestor is based upon the total quantity of Fixture-Units on each cold and hot water branch line.

Fixture-Unit Listing

Determine the total number of Fixture-Units on each branch line by referring to the list of fixtures in Table One.

Water Hammer Arrestor Selection

Refer to Table Two and select the water hammer arrestor model with proper Fixture-Unit capacity. In long batteries of fixtures over 20 feet in length, more than one water hammer arrestor will be required. (See placement data shown below.)

WATER HAMMER ARRESTOR PLACEMENT DATA

On multiple fixture branch lines up to 20 feet in length, the water hammer arrestor should be installed on the branch line between the last two fixtures being served. The water hammer arrestor should have a Fixture-Unit rating equal to or greater than the total Fixture-Units connected to the branch line.

On multiple fixture branch lines over 20 feet in length, two water hammer arrestors should be used on each line with the second unit placed at the approximate midpoint of the line. The sum of the Fixture-Unit ratings of the water hammer arrestors on each branch should be equal to or greater than the total Fixture-Units connected to the branch line.

Fixture Unit Capacity	1-11	12-32	33-60	61-113	114-1541	55-330

NOTES:

(1) All sizing data in this book are based on flow velocities of 10 feet per second or less.

- When the static water pressure in the line exceeds 65 psig, contact the MIFABEngr. (2)Dept
- (3) If the fixture-unit total has 1/2" fraction, it is to be "rounded-up" to the next larger whole number. If the total is 11-1/2 fixture units. use 12 fixture units.

(Dimension Denotes Millimeters)

PISTON TYPE WATER HAMMER ARRESTORS

MWH-NPB

MPB-2019-USA

- Thick walled seamless "K" copper body.
- RYTON™ PPS piston with two EPDM o-rings (Parco#5778-80) . with FDA(Dow Corning™#111) approved silicone lubricant. Ribbed piston design reduces secondary shock and flared piston skirt prevents hard particles suspended in the water supply from contacting the o-rings to provide increased product life.
- Large volume air chamber provides better dampening for superior • water hammer arrestor performance.
- Temperature range: maximum working temperature is 250 °F .
- Operating pressure: Water hammer arrestors are engineered for a . flowing pressure of up to 350 p.s.i. If the system pressure exceeds 350 p.s.i., a pressure reducing valve should be installed upstream of the arrestor to lower the line pressure.
- Engineered to limit the system surge pressure of 1,500 p.s.i. . Tested and certified to the A.S.S.E. 1010 and ANSI A112.26.1M Standards and listed with I.A.P.M.O. Patent # 6,539,976

FS1772,3,4-FL-PB	16" x 16" x 11" deep floor sink body, w/anchor flange,2",3",4" no hub conn.	60.00	\$ 4300.00
F\$1792,3,4-PB	24" x 16" x 17" deep floor sink body, 2", 3", 4" no hub connection	200.00	\$ 8536.00

NOTE: Transition floor sink bodies are available at the same price as the standard floor sink body pricing above. Transition floor sink bodies use the A3-PG gasket and the appropriate A1 body to attain the outlet connection size and type required. See the floor sink section of the www.mifab.com website for specification sheets on MIFAB's transition floor sink bodies. See page 100 for transition floor sink body heights.

F1340-TFB-PBV-1	12" round, nickel bronze sediment bucket veneer only	2.00		\$253.00
F1340-TFB-PBV-3	12" round, stainless steel sediment bucket veneer only	2.00		\$253.00
the F1340-TFB collar	or for the F1340-TFB grate veneer is F1320-PGV-1 for nickel bronze and F1320-PGV-3 for S.S. The part nur veneer is F1340-PGV-1 for nickel bronze and F1340-PGV-3 for S.S. All TFB veneers must have the ductile th them drilled and tapped at MIFAB® before the veneer can be installed.		3-PBV-1 or	
F1360-TFB-PBV-1	16" round, nickel bronze sediment bucket veneer only	3.50 3 image o		\$601.00
F1360-TFB-PBV-3	16" round, stainless steel sediment bucket veneer only	3.50 bucket	veneer	\$601.00
	for the F1360-TFB grate veneer is F1340-PGV-1 for nickel bronze and F1340-PGV-3 for S.S. The part number			

for nickel bronze and F1360-PGV-3 for S.S. All TFB veneers must have the ductile iron grates underneath them drilled and tapped at MIFAB before the veneer can be installed.

Note: This guide is prepared to assist in determining the MIFAB Catalog number which is similar to the J R Smith number referred to. Due to the simplified modular design of MIFAB products, this index indicates the product which is closest in design, based on function: eg. Free Area, Loading Rating, Depth, Material etc.

* Includes "-C" membrane clamp in areas with waterproof membrane. As a recommended alternate, use F1100 in non membrane areas, delete "-C" membrane clamp.

* MC-14 or MC-15 are recommended alternatives. Less pipe space, lower cost and fewer parts

MIFAB SUFFIX LISTING

SUFFIX	DESCRIPTION	-11	Acid resistant epoxy coating
01	Neoprene bowl gasket (MC-10-PBG)	-11	1/2" drain port in box (hydrants)
-1	Nickel bronze (drains and cleanouts)	-12	Galvanized metal dome (roof drains)
-1	Tiling frame (carriers) (MC-10-1-PTFK)	-12	Galvanized grate and frame (floor and area drains)
-2	Polished brass		(MC-10-PN12-31)
-3	Stainless steel (Type 304) (drains)	-12	12" tapered thread ABS nipple (carriers)
-3	Rear anchor support (carriers)	-12	Wheel handle (hydrants) (HY-9003)
-4	Ductile iron	-12A	Galvanized body and membrane clamp (roof drains)
-5	Sediment bucket	-12B	Grate painted black
-5	3/4" female solder adapter (hydrants)	-13	Galvanized body (floor and area drains)
-6	Security screws (floor and area drains, cleanouts)	-13	Galvanized body, membrane clamp and dome (roof drains)
-6	Vandal proof dome (roof drains)(H-1029)	-13	Test plug for custom and cast iron nipples (carriers)
-6	3/4" IPS 90 degree elbow and union nut (hydrants)	-14	Flat strainer (drains)
-7	Trap seal primer tapping	-14	Vandal proof finish trim (carriers) (MC-10-PFH-14)
-8	Backwater valve (drains)(BV1250 Series)	-15	Extension
-8	3/4" adapter vacuum breaker (hydrants) (HY-9005-CP)	-16	Square top assembly
-9	Hinged grate (drains)	-17	with trap and cleanout (MI-OS Series)
-9	1/4" drain port in box (hydrants)	-17	All galvanized (carriers)
-10	Decorative polished top (10 piece minimum) (drains)	-18	with trap and oil cone and cleanout (MI-OS Series)
-10	Auxiliary support (carriers) (MC-10-AFS)	-19	Nipple wrench (carriers) (MC-10-PCW)
-10	3/8" drain port in box (hydrants)	-20	Secondary dome strainer (drains) (FD-9600 Series)

MIFAB®, Inc., 1321 West 119th Street, Chicago, Illinois 60643-5109, USA

MPB-2019-USA

Grates and top rims shall be designed to meet the following loading classifications in a static condition.			
ŤŤŤ ř	Light Duty	All grates having safe live load (as calculated in paragraph 6.1.6 of the ANSI Standard) under 2,000 lbs. (900 kg.) For pedestrian foot traffic only.	
	Medium Duty	All grates having safe live load (as calculated in paragraph 6.1.6 of the ANSI Standard) between 2,000 lbs. (900 kg.) and 4,999 lbs. (2,250 kg.) For light pneumatic tire traffic only. Sidewalks and residential parking.	
	Heavy Duty	All grates having safe live load (as calculated in paragraph 6.1.6 of the ANSI Standard) between 5,000 lbs. (2,250 kg.) and 7,499 lbs. (3,375 kg.) For Commercial Pneumatic tire traffic patterns and tractor trailors.	
	Extra Heavy Duty	All grates having safe live load (as calculated in paragraph 6.1.6 of the ANSI Standard) between 7,500 lbs. (3,375 kg.) and 10,000 lbs. (4,500 kg.) For forklift traffic. Roads and Highways. H-20 Load Rated.	
	Special Duty	All grates having safe live load (as calculated in paragraph 6.1.6 of the ANSI Standard) over 10,000 lbs. (4,500 kg.) For airport traffic.	

DIN 19580

Grates and top rims shall be designed to meet the following loading classifications in a static condition.

ŤŤŤ Ť	Load Class A	Light Duty Grate design load up to or exceeding 3,372 lbs per foot. (15 kn). For pedestrian foot traffic only.
	Load Class B	Medium Duty Grate design load of at least 28,100 lbs per foot. (125 kn). For light pneumatic tire traffic only. Sidewalks and residential parking.
	Load Class C	Heavy Duty Grate design load of at least 56,200 lbs per foot. (250 kn). Commercial Applications.
	Load Class D	Grate design load of at least 89,920 lbs per foot. (400 kn). For pneumatic forklift traffic. Extra Heavy Duty. Roads and Highways. H-20 Load Rated.
	Load Class E	Grate design load of at least 134,800 lbs per foot. (600 kn). For Commercial Solid tire traffic patterns, and impacts from steel struts or metal wheels (forklifts). Extreme Heavy Duty.
	Load Class F	Grate design load of at least 202,320 lbs per foot. (900 kn). For airport traffic.

TRANSPORTATION CLASSIFICATIONS

The American Association of State Highway and Transportation Officials' (AASHTO) "Standard Specification for Highway Bridges" defines H-20 loading as a two-axle truck with a maximum dual-wheel load of 16,000 lbs. HS-20 loading is defined as a tractor truck with a tandem axle semitrailer with a dual- wheel load of 16,000 lbs. The FAA (Federal Aviation Administration) Advisory Circular AC 150/5320-6D describes aircraft loading as 100,000 lbs. placed over a 9" x 9" area.

The Americans with Disabilities Act (ADA) stipulates that the slot width be limited to 1/2" or less on gratings in walkways and elongated slots must be placed longitudinally so that they are perpendicular to the dominant direction of travel.

Heel Proof is defined as slots or perforations that are less than 1/4" in width or diameter. The maximum safe live load is calculated by dividing the load at failure by two.
